The Cambric migration experiment was undertaken in 1974 to provide data concerning the migration of radionuclides away from the site of a nuclear test where there is an induced hydraulic gradient. First, the distribution of radioactive isotopes around the site of the Cambric explosion was investigated by analysis of samples recovered from a hole drilled through the nuclear debris. Then water was pumped from a well, located 91 m away, to induce flow from the nuclear explosion site. Analyses of water samples showed that the migration velocity of tritium, ^{16}Cl, ^{85}Kr, ^{99}Tc, ^{106}Ru, and ^{129}I was nearly the same as that of the moving water, from the explosion site to the pumped well. Less than 0.5% of the total ^{90}Sr and 0.0003% of the total ^{137}Cs accompanied the tritium to the pumped well, although both isotopes appear to have migrated away from the source zone to some extent. The concentration of ^{239}Pu at the pumped well was below the detection limit of 10^6 atoms/mℓ in water collected at the time of peak tritium concentration. Peak tritium concentration in the pumped water occurred when 5,000,000 m^3 had been pumped

1574 (ORNL–6638) **Results of the radiological survey at the Sacandaga site Glenville, New York: Waste Management Research and Development Programs.** Foley, R.D.; Cottrell, W.D.; Carrier, R.F. Oak Ridge National Lab., TN (United States). Aug 1992. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93000503. Source: OSTI; NTIS; INIS; GPO Dep.

The Sacandaga site, located on Sacandaga Road, Glenville, New York, was operated by the General Electric Company for the Atomic Energy Commission (AEC) between 1947 and 1951. Originally used for the study and development of radar during World War II, the facilities housed later operations involving physics studies and sodium technology development in support of breeder reactor design and other AEC programs. Though not in use since

the original equipment was dismantled and removed in the early 1950s, portions of the 51-acre site are known to contain buried rubble from demolished structures used in former operations. At the request of the Office of Naval Reactors through the Office of Remedial Action and Waste Technology, a characterization of current radiological conditions over the site was performed between August and October 1989. The survey included the measurement of direct radiation levels (gamma, alpha, and beta-gamma) over all surfaces both inside and outside the building and tunnel, radionuclide analysis of systematic, biased, and auger hole soil samples, and analysis of sediments from underground structures. Gamma logging of auger holes was conducted and removable contamination levels inside the tunnel were determined. Samples of soil and structural materials from within and around an excavated concrete bunker were analyzed to determine concentrations of radionuclides and nonradioactive elemental beryllium.

1575 (ORNL/ER–90) **Model of the PCB and mercury exposure of mink and great blue heron inhabiting the off-site environment downstream from the US Department of Energy Oak Ridge Reservation: Environmental Restoration Program.** MacIntosh, D.L. (Indiana Univ., Bloomington, IN (United States). School of Public and Environmental Affairs); Suter, G.W. II; Hoffman, F.O. Oak Ridge National Lab., TN (United States). Sep 1992. 65p. Environmental Sciences Division Publication 3934.

This report presents a pair of wildlife exposure models developed for use in investigating the risks to wildlife of releases of mercury and PCBS. The species modeled are the great blue heron and mink The models may be used to estimate the exposure experienced by mink and herons, to help establish remedial action goals and to identify research needs. Because mercury and PCBs bioaccumulate through dietary uptake, the models simulate the food webs supporting the two species. Sources of contaminants include surface water, sediment, sediment pore water, and soil. The model are stochastic equilibrium models. Two types of variance in the input parameters are distinguished: stochastic variance among individual mink and herons and ignorance concerning true parameter values. The variance in the output due to stochastic parameters indicates the expected variance among the receptors. The variance due to ignorance indicates the extent to which the model outputs could be unpaved by additional sampling and measurement. The results of the models were compared to concentrations measured in great blue heron eggs and nestlings from colonies on the Clinch and Tennessee Rivers. The predicted concentrations agreed well with the measured concentrations. In addition, the variances in measured values among individuals was approximately equal to the total stochastic variance predicted by the models.

1576 (ORNL/RASA–91/19) **Radiological survey results at 13 Cliff Street, Beverly, Massachusetts (VB015).** Foley, R.D.; Johnson, C.A. Oak Ridge National Lab., TN (United States). Jul 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92041368. Source: OSTI; NTIS; INIS; GPO Dep.

At the request of the US Department of Energy (DOE), a team from Oak Ridge National Laboratory conducted a radiological survey at 13 Cliff Street, Beverly, Massachusetts. The survey was performed in May 1991. The purpose of the survey was to determine if uranium from work performed under government contract at the former Ventron facility had migrated off-site to neighboring areas. The survey included a surface gamma scan, a beta-gamma scan of paved areas, and the collection of soil samples for radionuclide analyses. Results of the survey demonstrated no radionuclide concentrations or radiation measurements in excess of the DOE Formerly Utilized Sites Remedial Action Program guidelines.

The survey included a surface gamma scan and the collection of soil samples for radionuclide analyses. Results of the survey demonstrated no radionuclide concentrations or radiation measurements in excess of the DOE Formerly Utilized Sites Remedial Action Program guidelines.

1582 (PNL–8143) **Fiscal year 1991 report on archaeological surveys of the 100 Areas, Hanford Site, Washington.** Chatters, J.C.; Gard, H.A.; Minthorn, P.E. Pacific Northwest Lab., Richland, WA (United States). Sep 1992. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001344. Source: OSTI; NTIS; INIS; GPO Dep.

In compliance with Section 106 of the National Historic Preservation Act (NHPA), and at the request of Westinghouse Hanford Company, the Hanford Cultured Resources Laboratory (HCRL) conducted an archaeological survey during FY 1991 of the 100-Area reactor compounds on the US Department of Energy's Hanford Site. This survey was conducted as part of a comprehensive resources review of 100-Area Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) operable units in support of CERCLA characterization activities. The work included a lite and records review and pedestrian survey of the project area following procedures set forth in the Hanford Cultural Resources Management Plan.

1583 (SA-PUB–9/89-Vol.1, pp. 167-176) **Determination of areal evapotranspiration from satellite data using a temperature/surface fluxes inversion model.** Sucksdorff, Y. (National Board of Waters and the Environment, Helsinki (Finland)); Ottle, C. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

A method for calculating areal evaporation by using synoptical weather data and satellite imaginery is presented. Many studies have shown that over vegetated areas, if the atmospheric and surface parameters are known, the energetic and hydraulic budgets at the surface can be modelised. Then the surface temperature estimated from satellite thermal IR-measurements permits to retrieve surface evaporation by inversion of the model /3,2,12/. This method, which has been developed at C.R.P.E., has been applied at a large scale in southern Finland. Landsat TM images and digitized map data are used for calculating the land-use parameters. The normalized difference vegetation index (NDVI) is calculated from NOAA-AVHRR images. To estimate the surface temperature from AVHRR channel 4 images the data have to be corrected of atmospheric attenuation. These corrections are done with a radiative transfer model Lowtran 6 and atmospheric vertical profiles given by radiosounding. First results for calculating areal evaporation in Finnish conditions are shown. The daily areal evapotranspiration, other surface fluxes, soil moisture, soil and canopy temperatures for July 1988 are calculated for one river basin having an area of about 1225 km^2. A comparison of the model against water balance method is presented.

1584 (SA-PUB–9/89-Vol.1, pp. 187-196) **Possible changes in forest hydrology following a global climatic change.** Lankreyer, H.J.M. (Univ. of Groningen, Harem (Netherlands). Dept. of Physical Geography and Soil Science); Veen, A.W.L. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

The parameterisation of forest evapotranspiration - as incorporated in a one-dimensional model, based on the Penman-Monteith equation - is applied to analyze interaction mechanisms in evaporation. Results are presented of a sensitivity study based on meteorological data, modified to simulate possible future climate conditions, and changed forest parameters. Higher rainfall and lower stomatal conductance will cause a significant increase of water draining from the forest soil. Reliability of rainfall predictions and of knowledge of stomatal reaction to climate change are recognised as important limitations.

1585 (SA-PUB–9/89-Vol.1, pp. 236-251) **Sensitivity of evapotranspiration and soil moisture to possible climatic changes.** Kuchment, L.S. (Water Problems Institute of the USSR Academy of Sciences, Moscow (USSR)); Motovilov, Y.G.; Startseva, Z.P. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

A physically based model of moisture transfer in the system 'soil - canopy - atmosphere' is used to estimate CO_2-induced changes in evapotranspirations. The model takes into account not only variations of atmosphere and vegetation characteristics, but also various mutual non-linear effects of heat and moisture transfer in soil and plants caused by these variations.

1586 (SA-PUB–9/89-Vol.1, pp. 252-261) **Soil moisture dynamics in South-Central Sweden in a 100 years perspective.** Andersson, L. (Sveriges Meteorologiska och Hydrologiska Inst., Norrkoeping (Sweden)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

International fluctuations of soil moisture deficits in south-central Sweden were analyzed in a 100 year perspective with the help of a dynamic water partitioning model. Considerable fluctuations of 10, 30 and 50-year mean deficits, a general secular trend towards higher summer deficits and larger fluctuations around the median were revealed. In the light of the critical importance of the choice of time period, the concepts of return and standard periods were challenged. A Geographical Information System (GIS) was used to detect alterations of the spatial distribution of areas with different probability to act as recharge or discharge areas. Wetness impacting human interventions were shown to, on average, have caused a slight desiccation of the landscape, although the impacts locally could be large.

1587 (SA-PUB–9/89-Vol.2, pp. 89-99) **The examination of runoff and loss of soil in field experiments with special reference to precipitation.** Kerenyi, A. (Kossuth University, Debrecen (Hungary). Dept. of Geography). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

Surface runoff, loss of soil, and concentration of load were measured in four experimental plots from spring to autumn for a period of three years. The measurements were primarily focused on the quantity, intensity (average intensity, 20- and 30-minute maximum intensity), drop energy, and the specific drop power of precipitations. The experiments were performed in three different stages. In the first stage the plots remained bare, in the second two of the plots were covered with plastic nets, while in the third stage the measurements were carried out in four different combinations: in a bare control plot, in a plot covered with nets, in one overgrown with vegetation and, finally, in a plot covered with both a net and vegetation. It was found that specific drop power has a decisive role in the production of load. The relationship between the various rain parameters and initial erosion was determined by means of correlation calculation. The highest correlation coefficients were obtained in the case of the 20-minute maximum intensity and specific drop power variant. It was also demonstrated that in the case of rains following dry spells surface runoff diminishes while the water's load concentration increases.

1588 (SCPRI-RM–3-1992) **Monthly results of measurements; March 1992.** Service Central de Protection contre les Rayonnements Ionisants, 78 - Le Vesinet (France). 1992. 59p. (In French). Order Number DE93720993. Source: OSTI; NTIS (US Sales Only); INIS.

This report of the SCPRI exposes the main results concerning the routine monitoring of environmental radioactivity in France: atmospheric dusts, rainwater, surface water, underground water,

sewage water, drinking water, food chain (milk, vegetables, fishes), sea water around nuclear sites and other sites. The activities of various radioisotopes are presented in tables.

This report of the SCPRI exposes the principal results concerning the routine monitoring of environmental radioactivity in France: atmospheric dusts, rainwater, surface water, underground water, sewage water, drinking water, food chain (milk, vegetables, fishes), sea water around nuclear sites and other sites. The activities of various radioisotopes are presented in tables.

1592 (SKB-TR–91-53) **Impact of a repository on permafrost development during glaciation advance.** Vallander, P. (VBB Viak AB, Stockholm (Sweden)); Eurenius, J. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1991. 95p. Order Number DE93603575. Source: OSTI; NTIS; INIS.

The study concerns the development of permafrost during the initial phase of a glaciation period in an area in Sweden, where a generic repository for spent nuclear fuel of type KBS-3 was assumed be located 600 m below the ground surface. The bedrock was assumed to consist of granite which could be superposed by till. An aim of the study was to assess, by calculations, if prerequisites could be developed for a forced ground water flow from an adjacent lake, past the repository and then up to an un-frozen ground surface above the repository. Results from computer calculations, carried out with a finite element program for a total simulation period of 10000 years, and with varied assumptions regarding final mean air temperature 5000 year ahead, indicated that permafrost development will be about the same in the ground immediately above the repository as in surrounding ground, and that conditions for the mentioned ground water flow could prevail during less than 10 years. It was also indicated that the impact on permafrost development in a zone with anomalous heat generation would be insignificant in comparison with the impact from a repository. (11 refs., 60 figs.) (au).

1593 (SKB-TR–91-54) **Hydraulic evaluation of the groundwater conditions at Finnsjoen. The effects on dilution in a domestic well.** Axelsson, C.L. (Golder Geosystem AB, Uppsala (Sweden)); Bystroem, J.; Eriksson, Aa.; Holmen, J.; Haitjema, H.M. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Sep 1991. 92p. Order Number DE93605410. Source: OSTI; NTIS; INIS.

The Swedish Nuclear Fuel and Waste Management Company (SKB) is presently performing a safety analysis study, SKB 91, for a final repository for spent nuclear fuel. The study is carried out for a generic repository located to the Finnsjoen area, which is one of SKBs oldest study-areas. An important part of the safety analysis is the dose calculations. Radionuclides can be transported to the biosphere via the sea, a lake, and via extraction of groundwater from drilled or dug wells. Thus, an important scenario to study is the dilution of radionuclides in a domestic well drilled in the future close to the repository. The present study is discussing; * Localization, drilling and construction of wells. * Specific capacities and chloride content of the rock mass and wells found in the Finnsjoe are. * Risk areas for future drilled wells. * Dilution in future wells drilled in fracture zones or in the hard rock in the vicinity of the repository. The evaluations show that a well pumping 6 m^3/day, located in a fracture zone or in the rock mass, has no influence on the local groundwater flow system except for the very vicinity of the well. Consequently, a well may be drilled in the hard rock without any risk of pumping groundwater that has passed the repository. Wells may also be located anywhere in fracture zones, except for in the very discharge area, without any risk of getting groundwater affected by the repository. Modelling indicate that a well drilled in the discharge area for contaminated groundwater, may collect all groundwater from the repository. However, this is based on assumptions of homogeneous continuous fracture zones with a high hydraulic conductivity compared to the rock mass, which will give rise to a concentrated discharge area. (44 refs., 31 figs., 6 tabs.) (au).

1594 (SKB-TR–91-56) **Microbes in crystalline bedrock. Assimilation of CO_2 and introduced organic compounds by bacterial populations in groundwater from deep crystalline bedrock at Laxemar and Stripa.** Pedersen, K. (University of Goeteborg, Dept. of General and Marine Microbiology, Goeteborg (Sweden)); Ekendahl, S.; Arlinger, J. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1991. 65p. Order Number DE93603576. Source: OSTI; NTIS; INIS.

The assimilation of CO_2 and of introduced organic compounds by bacterial populations in deep groundwater from fractured crystalline bedrock has been studied. Three depth horizons of the subvertical boreholes KLZ01 at Laxemar in southeastern Sweden, 830-841 m, 910-921 m and 999-1078 m, and V2 in the Stripa mine, 799-807m 812-820 m and 970-1240 m were sampled. The salinity profile of the KLX01 borehole is homogeneous and the groundwater had the following physico-chemical characteristics: pH values of 8.2, 8.4 and 8.5; Eh values of 270, no data and -220 mV; sulphide: 2.3, 11.0 and 5.6 μM; CO_3^{2-}: 104, 98 and 190 μM; CH_4: 26, 27 and 31 μl/l and N_2: 47, 25 and 18 ml/l, respectively. The groundwater in V2 in Stripa were obtained from fracture systems without close hydraulic connections and had the following physico-chemical characteristics: pH values of 9.5, 9.4 and 10.2; Eh values of +205, +199 and -3 mV; sulphide: 0, 106 and 233 μM; CO_3^{2-}: 50, 57 and 158 μM; CH_4: 245, 170 and 290 μl/l and N_2: 25, 31 and 25 ml/l, respectively. Biofilm reactors with hydrophilic glass surfaces were connected to the flowing groundwaters from each of the 3 depths with flow rates of approximately $3x10^{-3}$ m sec^{-1} over 19 days in Laxemar and 27 to 161 days in Stripa. There were between 0.15 to 0.68 x 10^5 unattached bacteria ml^{-1} groundwater and 0.94 to 1.2 x 10^5 attached bacteria cm^{-2} on the surface in Laxemar and from 1.6 x 10^3 up to 3.2 x 10^5 bacteria ml^{-1} groundwater and from 2.4 x 10^5 up to 1.1 x 10^7 bacteria cm^{-2} of colonized test surfaces in Stripa. Assuming a mean channel width of 0.1 mm, our results imply that there would be from 10^3 up to 10^6 more attached than unattached bacteria in a water conducting channel in crystalline bedrock. (54 refs., 23 figs., 10 tabs.) (au).

1595 (SKB-TR–91-58) **Exploratory calculations concerning the influence of glaciation and permafrost on the groundwater flow system, and an initial study of permafrost influences at the Finnsjoen site - an SKB 91 study.** Lindbom, B. (Kemakta Konsult AB, Stockholm (Sweden)); Boghammar, A. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1991. 60p. Order Number DE93603577. Source: OSTI; NTIS; INIS.

The present report describes some exploratory calculations concerning the potential groundwater flow during the recession phase of a future glaciation. The exercise forms part of the SKB 91 performance assessment project, and aims at qualitatively illustrating the prevailing hydrological phenomena under extreme glacier conditions, and at quantitatively indicating the order of magnitudes for

the groundwater flows that can be expected during the withdrawal of an ice-sheet. The interest has been focussed on the deglaciation phase, since it can be expected that large amounts of water are available for infiltration at this time. Conditions assuming either intact or melted away permafrost were considered within the project. Apart from the exploratory calculations mentioned above, an initial attempt at modelling a permafrost situation at the Finnsjoen site was carried out. This part of the study did not include the presence of melting-water, but was focussed on the potential occurrence of permafrost and its impact on the groundwater flow as a potential barrier. These calculations are reported separately in an Appendix. Neither part of the project addressed the conceptual uncertainties like potential crustal downwarping, thermal buoyancy effects by the heat evolution from the repository, fracture zone conductivities being affected by the overburden from the ice-shelf, etc, etc. The project made use of the finite element code NAMMU for solving the equation system, while the program package HYPAC was used for pre- and postprocessing purposes. (au).

1596 (SKB-TR–91-61) **Heat propagation from a radioactive waste repository. SKB 91 reference canister.** Thunvik, R. (Royal Inst. of Technology, Stockholm (Sweden)); Braester, C. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Mar 1991. 43p. Order Number DE93603605. Source: OSTI; NTIS; INIS.

A study of heat propagation around a hypothetical radioactive waste repository is presented. The investigated flow domain was limited to a quarter of the flow domain around a single canister due to symmetry by vertical planes passing through the centre of the canister, half distance between the adjacent tunnels and the adjacent canisters. Strictly speaking, such an approach is applicable to a repository of infinite extent. However, from a practical point of view this assumption applies to all canisters but the ones close to the edge of the repository. The following different material regions were considered: (a.) Canister containing the spent fuel, (b.) Buffer (bentonite) around the canister, (c.) Backfilled (mixture of bentonite and sand) tunnels, and (d.) host Rock. The canister material was presented by a 'homogenized' medium obtained by weighted averaging of the main constituents of the canister, viz. spent fuel, copper and lead. A geothermal gradient of 13 degrees C/km was assumed. The initial heat effect per canister was 1066 W. The total vertical extent of the flow domain considered was about 1500 meters. The base case, with 6.2 m canister spacing and 30 m tunnel spacing, resulted in a maximum temperature at the canister/buffer interface of about 66 degrees C (corresponding to a temperature rise of about 54 degrees C), and about 50 degrees C (about 38 degrees C temperature rise) in the rock. (au).

1597 (SKB-TR–92-02) **Sternoe study site. Scope of activities and main results.** Ahlbom, K. (Conterra AB, Uppsala (Sweden)); Andersson, J.E.; Nordqvist, R.; Tiren, S.; Ljunggren, C.; Voss, C. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1992. 68p. Order Number DE93603578. Source: OSTI; NTIS; INIS.

During the period from 1977-1986 SKB (Swedish Nuclear Fuel and Waste Management Co) performed surface and borehole investigations of 14 study sites for the purpose of assessing their suitability for a repository of spent nuclear fuel. The next phase in the SKB site selection programme will be to perform detailed characterization, including characterization from shafts and/or tunnels, of two or three sites. The detailed investigations will continue over several years to provide all the data needed for a licensing application to build a repository. Such an application is foreseen to be given to the authorities around the year 2003. It is presently not clear if anyone of the previously investigated study sites will be selected as a site for detailed characterization. Other sites with geological and/or socio-economical characteristics judged more favourable may very well be the ones selected. However, as a part of the background documentation needed for the site selection studies to come, summary reports will be prepared for most study sites. These reports will include scope of activities, main results, uncertainties and need of complementary investigations. This report concerns the Sternoe study site. This site was one of the first sites to be investigated by SKB . The studies at Sternoe were made under severe time-constraints and with prototype borehole instrumentations. These limitations should be kept in mind when reading the report. (41 refs., 16 figs., 12 tabs.) (au).

1598 (SKB-TR–92-06) **Characterization of nearfield rock - A basis for comparison of repository concepts.** Pusch, R. (Clay Technolgy AB and Lund Univ. of Technology, Lund (Sweden)); Hoekmark, H. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1991. 145p. Order Number DE93603579. Source: OSTI; NTIS; INIS.

The hydraulic conductivity of the nearfield rock controls the rate of wetting of adjacent buffer material as well as the rate of degradation of its smectite content and of the transport of radionuclides from the buffer/rock interface. Comparison of different repository concepts with respect to the function of the nearfield rock requires a common rock structure model, which is suggested in the report. Applying this model and 2D and 3D numerical calculations for evaluation of stress-induced structural changes, major differences between the three concepts VDH, KBS3 and VLH concerning the hydraulic conductivity of the nearfield have been identified. The importance of the orientation of the excavations turns out to be particularly obvious. Further development of the rock structure model is concluded to offer ways of quantifying more accurately the damaging effects of blasting and TBM-drilling. (au).

1599 (SKB-TR–92-07) **Discrete fracture modelling of the Finnsjoen rock mass: Phase 2.** Geier, J.E. (Golder Geosystem AB, Uppsala (Sweden)); Axelsson, C.L.; Haessler, L.; Benabderrahmane, A. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Apr 1992. 293p. Order Number DE93603580. Source: OSTI; NTIS; INIS.

A discrete fracture network (DFN) model of the Finnsjoen site was derived from field data, and used to predict block-scale flow and transport properties. The DFN model was based on a compound Poisson process, with stochastic fracture zones, and individual fracture concentrated around the fracture zones. This formulation was used to represent the multitude of fracture zones at the site which could be observed on lineament maps and in boreholes, but were not the focus of detailed characterization efforts. Due to a shortage of data for fracture geometry at depth, distributions of fracture orientation and size were assumed to be uniform throughout the site. Transmissivity within individual fracture planes was assumed to vary according to a fractal model. Constant-head packer tests were simulated with the model, and the observed transient responses were compared with actual tests in terms of distributions of interpreted transmissivity and flow dimension, to partially validate the model. Both simulated and actual tests showed a range of flow dimension from sublinear to spherical, indicating local variations in the connectivity of the fracture population. A methodology was developed for estimation of an effective stochastic continuum from the DFN model, but this was only partly demonstrated. Directional conductivities for 40 m block were estimated using the DFN model. These show extremely poor correlation with results of multiple packer tests in the same blocks, indicating possible limitation of small-scale packer tests for predicting block-scale properties. Estimates are given of effective flow porosity and flow wetted surface, based on the block-scale flow fields calculated by the DFN model, and probabilistic models for the relationships among local fracture transmissivity, void space, and specific surface. The database for constructing these models is extremely limited. A review is given of the existing database for single fracture hydrologic properties. (127 refs.)

1600 (SKB-TR–92-08) **Statistical inference and comparison of stochastic models for the hydraulic conductivity at the Finnsjoen-site.** Norman, S. (Starprog AB (Sweden)). Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Apr 1992. 136p. Order Number DE93603581. Source: OSTI; NTIS; INIS.

The origin of this study was to find a good, or even the best, stochastic model for the hydraulic conductivity field at the Finnsjoe site. The conductivity field in question are regularized, that is upscaled. The reason for performing regularization of measurement data is primarily the need for long correlation scales. This is needed in order to model reasonably large domains that can be used when describing regional groundwater flow accurately. A theory of regularization is discussed in this report. In order to find the

best model, jacknifing is employed to compare different stochastic models. The theory for this method is described. In the act of doing so we also take a look at linear predictor theory, so called kriging, and include a general discussion of stochastic functions and intrinsic random functions. The statistical inference methods for finding the models are also described, in particular regression, iterative generalized regression (IGLSE) and non-parametric variogram estimators. A large amount of results is presented for a regularization scale of 36 metre. (30 refs.) (au).

1601 (SKN–58) **Basis for localization facilities for final disposal of spent nuclear fuel. Part 1: General geological survey.** Lundqvist, T. (Svensk Ingenjoerstjaenst SINTAB AB, Bromma (Sweden)); Samuelsson, L.; Scherman, S. National Board for Spent Nuclear Fuel, Stockholm (Sweden). Apr 1992. 72p. (In Swedish). Order Number DE93605432. Source: OSTI; NTIS; INIS.

A review of the knowledge on the Swedish bedrock with application to geologic disposal of spent nuclear fuel waste in crystalline rock.

1602 (SKN–62) **Simulation of the migration in fracutred rock by a model based on capillary tubes.** Dahlbom, P. (Lund Univ. (Sweden). Dept. of Water Resources Engineering). National Board for Spent Nuclear Fuel, Stockholm (Sweden). May 1992. 47p. Order Number DE93603558. Source: OSTI; NTIS; INIS.

In this paper the ability of a model based upon capillary tubes to reproduce the hydrodynamic dispersion in connection with flow of contaminated groundwater in fractured rock is investigated. It is assumed that the cross sectional areas are circular and that the flow is laminar. The molecular diffusion is neglected as well as the impact of variations in velocity over the cross-sectional area. It is assumed that the cross sectional areas in an ensemble of tubes belong to a gamma distribution. The velocity differences between tubes having different cross sectional area cause hydrodynamic dispersion. The model is applied to field tracer experiments at two sites. It is shown that the mean size of the cavities is smaller at a large depth and that the distribution is more narrow. The parameter in the gamma distribution has to be given different values to reproduce the breakthrough course at the different sites. It is also pointed out that there is no general relation between conductivity of a porous medium and its porosity without consideration of the pore size distribution. (au).

1603 (SKN–63) **Hydraulic gradients in rock aquifers.** Dahlblom, P. (Lund Univ. (Sweden). Dept. of Water Resources Engineering). National Board for Spent Nuclear Fuel, Stockholm (Sweden). May 1992. 73p. Order Number DE93603559. Source: OSTI; NTIS; INIS.

This report deals with fractured rock as a host for deposits of hazardous waste. In this context the rock, with its fractures containing moving groundwater, is called the geological barrier. The desired properties of the geological barrier are low permeability to water, low hydraulic gradients and ability to retain matter dissolved in the water. The hydraulic gradient together with the permeability and the porosity determines the migration velocity. Mathematical modelling of the migration involves calculation of the water flow and the hydrodynamic dispersion of the contaminant. The porous medium approach can be used to calculate mean flow velocities and hydrodynamic dispersion of a large number of fractures are connected, which means that a large volume have to be considered. It is assumed that the porous medium approach can be applied, and a number of idealized examples are shown. It is assumed that the groundwater table is replenished by percolation at a constant rate. One-dimensional analytical calculations show that zero hydraulic gradients may exist at relatively large distance from the coast. Two-dimensional numerical calculations show that it may be possible to find areas with low hydraulic gradients and flow velocities within blocks surrounded by areas with high hydraulic conductivity. (au).

1604 (STRIPA-TR–91-34) **Final report of the rock sealing project - Sealing of the near-field rock around deposition holes by use of bentonite grouts.** Boergesson, L. (Clay Technology AB, Lund (Sweden)); Pusch, R.; Fredrikson, A.; Hoekmark, H.; Karnland, O.; Sanden, T. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1991. 194p. Order Number DE93603560. Source: OSTI; NTIS; INIS.

Test 1 of the rock sealing project comprised determ ination of the hydraulic properties of the rock around large-diameter holes like canister deposition holes or TBM tunnels and attempts were made to seal the fractures intersecting such holes with bentonite slurry. The heater holes from the buffer mass test which are 76 cm in diameter, were used and injection made from inside the holes with a specially designed device using dynamic injection technique. The hydraulic properties of the surrounding rock were tested by use of the same device before and after the injections, as well as after a 3 months heat pulse. The results were interpreted by applying a special derived grout flow model and by analyzing the rock response through different calculation techniques, as well as by localizing the injected grout by rock excavation. The experiments showed that grouting of fractured rock by using the applied technique can give very significant sealing. (au).

1605 (STRIPA-TR–92-01) **Modelling tracer transport in fractured rock at Stripa.** Herbert, A. (AEA Decommissioning and Radwaste, Oxfordshire (United Kingdom). Harwell Laboratory); Lanyon, G. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1992. 198p. Order Number DE93603561. Source: OSTI; NTIS; INIS.

We present the results of a modelling study, making predictions for tracer transport experiments carried out within the H-zone feature in the Stripa mine. We use a direct fracture network approach to represent the system of interconnected flow-conducting fractures comprising this zone. It is a highly fractured granite, and our fracture-network models include up to 60000 fractures. We have had to develop efficient algorithms to calculate the flow and transport through these networks; these techniques are described and justified. The first stage of modelling addressed two saline injection experiments. The results of these were known to us and so in addition to 'predicting' the results of these experiments, we used them to calibrate a flow model of the experimental site. This model was then used to make true 'blind' predictions for a set of tracer experiments carried out in the natural head-field, caused by an open drift. Where our flow model was good, our predictions were found to be very accurate, explaining the dispersion in the tracer breakthrough in terms of the fracture network geometry. Discrepancies for experiments in less well characterised regions of the H-zone are presented, and we suggest that the errors in these predictions are a consequence of the inaccuracies of the flow-field. We have demonstrated the use of large-scale fracture network modelling. It has proved very successful, and made very accurate predictions of field experiments carried out at the Stripa mine. The measured dispersion of tracers can be accounted for by the geometry of the fracture network flow system. (14 refs.) (au).

1606 (STRIPA-TR–92-02) **Site characterization and validation - tracer migration experiment in the validation drift, report 1: instrumentation site preparation and tracers.** Birgersson, L. (Kemakta Consultants Co., Stockholm (Sweden)); Aagren, L. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1992. 102p. Order Number DE93603586. Source: OSTI; NTIS; INIS.

The tracer migration experiment has been performed as a part of the site characterization and validation project in the Stripa experimental mine. Tracers were injected in sealed off borehole sections in the average fractured rock and in a 6 m wide fracture zone intersecting a 50 m long drift. Distances from the tracer injection sections to the drift were 10-25 m. Plastic sheets and short sumpholes were used to collect water and tracers emerging into the drift in 270 sampling areas, each with the size of 1-2 m^2. Tracer concentrations were measured during 10 months and breakthrough curves were obtained for seven injection sections. This report described the experimental layout of the experiment and the equipment used. It also points at advantages/disadvantages with the two sets of tracers used in the experiment; dyes and metal complexes. (au).

1607 (STRIPA-TR–92-03(pt.1)) **Site characterization and validation - Tracer migration experiment in the validation drift, report 2, part 1: performed experiments, results and evaluation.** Birgersson, L. (Kemakta Consultatnts Co., Stockholm

(Sweden)); Widen, H.; Aagren, T.; Neretnieks, I.; Moreno, L. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1992. 272p. Order Number DE93603587. Source: OSTI; NTIS; INIS.

This report is the second of the two reports describing the tracer migration experiment where water and tracer flow has been monitored in a drift at the 385 m level in the Stripa experimental mine. The tracer migration experiment is one of a large number of experiments performed within the Site Characterization and Validation (SCV) project. The upper part of the 50 m long validation drift was covered with approximately 150 plastic sheets, in which the emerging water was collected. The water emerging into the lower part of the drift was collected in short boreholes, sumpholes. Sex different tracer mixtures were injected at distances between 10 and 25 m from the drift. The flowrate and tracer monitoring continued for ten months. Tracer breakthrough curves and flowrate distributions were used to study flow paths, velocities, hydraulic conductivities, dispersivities, interaction with the rock matrix and channelling effects within the rock. The present report describes the structure of the observations, the flowrate measurements and estimated hydraulic conductivities. The main part of this report addresses the interpretation of the tracer movement in fractured rock. The tracer movement as measured by the more than 150 individual tracer curves has been analysed with the traditional advection-dispersion model and a subset of the curves with the advection-dispersion-diffusion model. The tracer experiments have permitted the flow porosity, dispersion and interaction with the rock matrix to be studied. (57 refs.).

1608 (STRIPA-TR–92-03(pt.2)) **Site characterization and validation - Tracer migration experiment in the validation drift, report 2, Part 2: breakthrough curves in the validation drift appendices 5-9.** Birgersson, L. (Kemakta Consultants Co., Stockholm (Sweden)); Widen, H.; Aagren, T.; Neretnieks, I.; Moreno, L. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1992. 390p. Order Number DE93603588. Source: OSTI; NTIS; INIS.

Flowrate curves for the 53 sampling areas in the validation drift with measureable flowrates are given. The sampling area 267 is treated as three separate sampling areas; 267:1, 267:2 and 267:3. The total flowrate for these three sampling areas is given in a separate plot. The flowrates are given in ml/h. The time is given in hours since April 27 00:00, 1990. Disturbances in flowrates are observed after 8500 hours due to opening of boreholes C1 and W1. Results from flowrate measurements after 8500 hours are therefore excluded. The tracer breakthrough curves for 38 sampling areas in the validation drift are given as concentration values versus time. The sampling area 267 is treated as three separate sampling areas; 267:1, 267:2 and 267:3. This gives a total of 40 breakthrough curves for each tracer. (au).

1609 (STRIPA-TR–92-05) **Prediction of flow and drawdown for the site characterization and validation site in the Stripa mine.** Long, J. (Earth Sciences Division LBL, University of California, Berkeley, CA (United States)); Mauldon, A.; Nelson, K.; Martel, S.; Fuller, P.; Karasaki, K. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1992. 130p. Order Number DE93603590. Source: OSTI; NTIS; INIS.

Geophysical and hydrologic data from a location in the Stripa mine in Sweden (Site Characterization and Validation (SCV) block) has been used to create a series of models for flow through the fracture network. The models can be characterized as 'equivalent discontinuum' models. Equivalent discontinuum models are derived starting from a specified lattice or 'template'. An inverse analysis called 'simulated annealing' is used to make a random search through the elements of the lattice to find a configuration that can reproduce the measured responses. Evidence at Stripa points to hydrology dominated by fracture zones. These have been identified and located. Lattice templates were arranged to lie on the fracture zones identified by Black and Olsson. Goal of this project was to build a fracture flow model based on an initial data set, and use this model to make predictions of the flow behavior during a new test. Then given data from the new test, predict a second test, etc. The first data set was an interference test called C1-2. Both a two-dimensional and a three-dimensional model were annealed to the C1-2 data and use this model to predict the behavior of the Simulated Drift Experiment (SDE). The SDE measured the flow into, and drawdown due to reducing the pressure in a group of 6 parallel boreholes. Then both the C1-2 and SDE data were used to predict the flow into a drawdown due to an excavation, the Validation Drift (VD), made through the boreholes. Finally, all the data was used to predict the hydrologic response to opening another hole, T1. Annealing to the C1-2 test gave an excellent prediction of the SDE. The VD effects were dominated by near-field physics that were not predictable. However, the calculations and measurements could be used to postulate that a dramatic decrease in hydraulic conductivity near the drift was due to degassing of nitrogen as the inflowing water was depressurized.

1610 (STRIPA-TR–92-06) **Simulation of tracer transport for the site characterization and validation site in the Stripa mine.** Long, J. (Earth Science Division, LBL Univ. of California, Berkeley (United States)); Karasaki, K. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1992. 104p. Order Number DE93603591. Source: OSTI; NTIS; INIS.

Tracer simulations for transport in a fracture zone were made based on two equivalent discontinuum models of a fracture zone (the H-zone) at the Stripa mine. The two models were derived from simulated annealing inversions of hydraulic tests in the H-zone. A comparison with the data shows that, in general the simulations are able to predict arrival time quite well. This means that the information from the interference tests was a good prediction of tracer travel path length. Prediction of the maximum C/C_o was not as good but was fairly close in about half the predictions. The most important recommendation of this report is that future studies of tracer transport in fracture networks should be done solely from boreholes which are held at pressures above atmospheric to maintain single phase conditions. There are many things that are not fully understood about the physics of the transport phenomenon in fractures and coupling these two problems makes it very difficult to interpret the experiments. The SCV project has shown clearly that the hydrology of excavations is not well understood. (au).

1611 (STRIPA-TR–92-07) **A comparison of measurements and calculations for the Stripa validation drift inflow experiment.** Hodgkinson, D.P. (Intera Information Tehnologies, Henley-on-Thames (United Kingdom)); Cooper, N.S. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1992. 103p. Order Number DE93603592. Source: OSTI; NTIS; INIS.

This data presents a comparison of measurements and predictions for groundwater flow to the validation drift and remaining portions of the D-holes in the Site Characterisation and Validation (SCV) block. The comparison was carried out of behalf of the Stripa task force on fracture flow modelling. The paper summarises the characterisation data and their preliminary interpretation, and reviews the fracture flow modelling approaches and predictions made by teams from AEA Technology/Fracflow, Golder Associated and Lawrence Berkely Laboratory. The predictions are compared with the inflow measurements on the basis of the validation process and criteria defined by the Task Force. The results of all three modelling groups meet the validation criteria, with the predictions of the inflow being of the same order of magnitude as the observations. Also the AEA/Fracflow and Golder approaches allow the inflow pattern to be predicted and this too is reproduced with reasonable accuracy. The successful completion of this project demonstrates the feasibility of discrete fracture flow modelling, and in particular the ability to collect and analyse all the necessary characterization data in a timely and eccnomic manner. (32 refs.) (au).

1612 (STRIPA-TR–92-08) **Final report of the rock sealing project - identification of zones disturbed by blasting and stress release.** Boergesson, L. (Clay Technology AB, Lund (Sweden)); Pusch, R.; Fredriksson, A.; Hoekmark, H.; Karnland, O.; Sanden, R. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1992. 211p. Order Number DE93603562. Source: OSTI; NTIS; INIS.

Tests 2 and 3 of the rock sealing project comprised determination of the hydraulic properties of the disturbed rock around tunnels and drifts and the possibilities of decreasing the hydraulic conductivity of the disturbed zones by an attempt to seal the very fine

fractures that are causing the increased conductivity. This report deals with the hydraulic testing while the grouting procedures and their effect are described in volume 3. The BMT drift was used for the experiments which basically consisted of measuring the flow of water from an inner pressurized slot and borehole curtain to an outer curtain with zero water pressure (Macro Flow Test). The 12 m long drift was sealed from water inflow by a slurry that filled the entire drift. The slurry was pressurized by a large water filled bladder for eliminating leakage along and through the drift. The flow tests were primarily evaluated by finite element modeling in which the rock was considered an equivalent porous medium. Two possible rock models were developed that satisfied not only the flow and water pressure measurements during the macro flow test but also 3 different flow situations preceding the test. The models imply a shallow blast-disturbed zone with a strongly increased hydraulic conductivity, and a stress disturbed zone with a decreased radial hydraulic conductivity. The main difference between the models is the extension of the blast-damaged zone and the axial hydraulic conductivity of the stress disturbed zone. (au).

1613 (STRIPA-TR–92-09) **A compilation of minutes for the Stripa task force on fracture flow modelling.** Hodgkinson, D. (Intera Information Technologies, Henley-on-Thames (United Kingdom)). Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1992. 215p. Order Number DE93603593. Source: OSTI; NTIS; INIS.

This report is a compilation of minutes from the nine meetings of the Stripa task force on fracture flow modelling, held at various locations around the world from February 1988 to December 1991. The task force was set up as a peer review group with the specific objectives of 1. recommending criteria for the verification and validation of fracture flow models, 2. facilitating the dissemination of information to countries participating in the Stripa project, and 3. coordinating the work of the three modelling groups form AEA Harwell, Golder Associates and Lawrence Berkeley Laboratory. The report provides a detailed technical commentary of the interplay between the development and application of mathematical models, and the design, execution and interpretation of experiment, within a structured project management framework. In particular, the task force has pioneered the definition and implementation of a validation process and associated criteria based on the analysis of a wide range of experimental data. (au).

1614 (STRIPA-TR–92-10) **A site characterization and validation - Porous media modelling of validation tracer experiments.** MacLeod, R. (Fracflow Consultants Inc., St. Johns, NF (Canada)); Gale, J.; Bursey, G. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1992. 137p. Order Number DE93603594. Source: OSTI; NTIS; INIS.

A three dimensional porous media model of the SCV site was developed to predict the observed hydraulic head distribution in the SCV site as well as the measured flux to the D boreholes during the simulated drift experiment (SDE) and the flux to the Validation drift. The SCV flux model was calibrated to reproduce the observed distribution of flux in the D boreholes and the validation drift and was used as the basis for simulating the solute transport of the tracer experiments carried out in the SCV site. The SCV transport model was calibrated using the measured breakthrough curves for the saline tracer tests. The porous media numerical simulations of the validation tracer experiments were designed to predict the transport of conservative tracers through the rock mass from selected boreholes in the SCV site. This prediction consisted of computing the tracer breakthrough curves for the validation drift as well as predicting t_5 and t_{50}, time to reach 5% and 50% of the 'steady state' breakthrough, and C_{ss}/C_o, the normalized steady state breakthrough concentrations for each experiment. The computed distribution of hydraulic heads and tracer concentrations indicates that there is a relatively strong horizontal as well as vertical gradient in the H zone. Tracer from the more distant boreholes appears to bypass the drift and only appears in the drift as a result of lateral dispersion. A preliminary comparison of the predicted tracer results with the measured results, based on the breakthrough curves and values of t_5, shows that in general the predicted tracer arrival times at the drift were too early and the predicted steady state relative concentrations of tracer were lower than measured. (au).

1615 (STRIPA-TR–92-11) **Fully-coupled hydro-mechanical modelling of the D-holes and validation drift inflow.** Monsen, K. (Norwegian Geotechnical Inst., Oslo (Norway)); Barton, N.; Makurat, A. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Feb 1992. 48p. Order Number DE93603595. Source: OSTI; NTIS; INIS.

This report presents the results from fully-coupled hydro-mechanical modelling of the D-hole and drift inflows. Joints represented in Harwells stochastically generated 8m x 8m x 8m cubes were used to select two possible joint geometries for two-dimensional rock mechanics simulations of the 2.8 x 2.2m validation drift, and the rock mass response to its excavation. The joints intersecting the four end faces of these cubes were set up in distinct element UDEC-BB models and loaded with boundary stresses of 10 MPa vertically and 14 MPa horizontally. In numerical models 5 and 8, which were run first as mechanical response (M) models (TR 91-05), full H-M coupling was performed, with calculations of inflow. In general, response to excavation was a little stronger than in hte un-coupled mechanical response (M) modelling. In the D-hole simulations, however, channel development int he disturbed zone could not occur due to less displacement taking place in the rock mass. For this reason, the stress levels were also generally much more moderate, preventing the joints from closing as much as in the drift simulations. Consequently, the D-hole model had a much better radial connectivity. It was possible to observe that the radial inflow to the D-holes was significantly higher than the flow into the drift models. However, due to the extremely small joint apertures involved ($<1\mu$m), time steps and calculation times were very slow in the H-M models, and although mechanical behaviour appeared to have reached equilibrium, there was evidence of continued transients in some of the flow regions. The drift excavation caused nearly total closing of critical joints due to local normal stress inceases. Near-blockage of fluid transportation routes was demonstrated. (au).

1616 (STRIPA-TR–92-12) **Rock mechanics characterization and modelling of the disturbed zone phenomena at Stripa.** Barton, N. (Norwegian Geotechnical Inst., Oslo (Norway)); Makurat, A.; Monsen, K.; Vik, G.; Tunbridge, L. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Feb 1992. 64p. Order Number DE93603596. Source: OSTI; NTIS; INIS.

The rock mechanics test programme undertaken by NGI in Phase 3 of the Stripa project consisted initially of small scale joint characterisation using 100 mm drill core, and larger scale coupled testing of the hydro-mechanical behaviour of joints. Stress-closure-flow and shear-dilation-flow testing was performed in joints of 200 mm length in NGI's CSFT apparatus, and on a joint of 1400 mm length using a 1m x 1m in situ block test in the floor of the 3D drift. The subsequent numerical modelling using the discrete element code UDEC-BB was directed towards the investigation of potential excavation-induced changes in joint aperture and permeability caused by the validation drift. The net effects were expected to be changed radial permeability that might be reduced locally, and changed axial permeability that might be increased locally. Comparisons were made between the mechanical behaviour of continuum models, and jointed models with either average joint properties (models 1 to 4) or joint-length-dependent properties (models 5 to 8). Significant differences were noted. UDEC-BB models with fully coupled (hydro-mechanical) behaviour were also run to compare inflows into a simulated drift (SDE) D-hole model with inflows into a drift excavation in the same joint model. Flow was found to reduce from 0.12 litres/min. per 1 m length of D-holes to 0.03 litres/min. per 1 m length of validation drift. In practice, an 80 to 90% reduction in inflow has been observed between D-holes and drift excavation, but in both cases inflows are about and order of magnitude less than the above. (23 refs.) (au).

1617 (STRIPA-TR–92-13) **Site characterization and validation - Head variations during the entire experimental period.** Haigh, D. (Golder Associates Ltd., Nottingham (United Kingdom)); Brightman, M.; Black, J.; Parry, S. Swedish Nuclear Fuel and

Waste Management Co., Stockholm (Sweden). Jan 1992. 122p. Order Number DE93603597. Source: OSTI; NTIS; INIS.

The site characterization and validation project lasted for five years from 1986 to 1991. It consisted of a number of experiments within the region known as the SCV site. During this period of experimentation a monitoring system was established within the mine for the purpose of measuring the variation of head at a number of locations within and around the site. The system installed was based around a set of equipment known as a Piezomac ™ system. In this system there is one central pressure transducer and each borehole interval is connected to it in turn. It can measure up to 55 separate points during each measurement 'cycle'. Monitoring points were either complete boreholes or sections of boreholes isolated by packers. In order to produce reasonable file size, data sets were screened. The results show that the SCV site was always responding to some form of hydrogeological disturbance. Many key tests were performed against changing background trends. This was particularly so of the simulated drift experiment and the large scale crosshole tests. However, some estimates of long term equilibrium heads before and after excavation of the validation drift have been made. Contoured plots of heads before and after show significant reduction of steady state heads as a result of drift excavation. Furthermore contouring the estimated long term drawdowns responding to the simulated drift experiment shows the specific influence of the H zone and the A/B zone. Overall the results of the monitoring show that the mine was a very active hydrogeological environment during the experimentation. Additionally it was often very difficult to clearly identify the causes of such disturbances. (au).

1618 (STRIPA-TR–92-15) **Discrete fracture modelling for the Stripa tracer validation experiment predictions.** Dershowitz, W. (Golder Associates Inc., Redmond, WA (United States)); Wallmann, P. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Feb 1992. 119p. Order Number DE93603599. Source: OSTI; NTIS; INIS.

Groundwater flow and transport through three-dimensional networks of discrete fractures was modeled to predict the recovery of tracer from tracer injection experiments conducted during phase 3 of the Stripa site characterization and validation protect. Predictions were made on the basis of an updated version of the site scale discrete fracture conceptual model used for flow predictions and preliminary transport modelling. In this model, individual fractures were treated as stochastic features described by probability distributions of geometric and hydrologic properties. Fractures were divided into three populations: Fractures in fracture zones near the drift, non-fracture zone fractures within 31 m of the drift, and fractures in fracture zones over 31 meters from the drift axis. Fractures outside fracture zones are not modelled beyond 31 meters from the drift axis. Transport predictions were produced using the Frac-Man discrete fracture modelling package for each of five tracer experiments. Output was produced in the seven formats specified by the Stripa task force on fracture flow modelling. (au).

1619 (STRIPA-TR–92-17) **Geochemical modelling of grout-groundwater-rock interactions at the seal-rock interface.** Alcorn, S. (RE/SPEC Inc., Albuquerque, NM (United States)); Christian-Frear, T. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Feb 1992. 64p. Order Number DE93603600. Source: OSTI; NTIS; INIS.

Theoretical investigations into the longevity of repository seals have dealt primarily with the development of a methodology to evaluate interactions between portland cement-based grout and groundwater. Evaluation of chemical thermodynamic equilibria among grout, groundwater, and granitic host rock phases using the geochemical codes EQ3NR/EQ6 suggests that a fracture filled with grout and saturated with groundwater will tend to fill and 'tighten' with time. These calculations predict that some grout and rock phases will dissolve, and that there will be precipitation of secondary phases which collectively have a larger overall volume than that of the material dissolved. Model assumptions include sealing of the fracture in a sluggish hydrologic regime (low gradient) characterized by a saline groundwater environment. The results of the calculations suggest that buffering of the fracture seals chemical system by the granitic rock may be important in determining the long-term fate of grout seals and the resulting phase assemblage in the fracture. The similarity of the predicted reaction product phases to those observed in naturally filled fractures suggests that with time equilibrium will be approached and grouted fractures subject to low hydrologic gradients will continue to seal. If grout injected into fractures materially reduces groundwater flux, the approach to chemical equilibrium will likely be accelerated. In light of this, even very thin or imperfectly grouted fractures would tighten in suitable hydrogeologic environments. In order to determine the period of time necessary to approach equilibrium, data on reaction rates are required. (au).

1620 (STRIPA-TR–92-20) **A comparison of measurements and calculations for the Stripa tracer experiments.** Hodgkinson, D.P. (Intera Information Technologies, Henley-on-Thames (United Kingdom)); Copper, N.S. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Mar 1992. 156p. Order Number DE93603601. Source: OSTI; NTIS; INIS.

This paper presents a comparison of measurements and predictions for migration of tracers from boreholes to the validation drift and to other boreholes in the Site Characterisation and Validation (SCV) block. The comparison was carried out on behalf of the Stripa task force on fracture flow modelling. The paper summarises the radar/saline tracer experiments, the tracer migration experiment observations and reviews the fracture flow and tracer transport modelling approaches and predictions made by AEA Technology, Fracflow Consultants, Golder Associates and Lawrence Berkeley Laboratory. The predictions are compared with the observed breakthrough curves on the basis of the validation process and criteria defined by the task force. The results of all four modelling groups met the validation criteria, with the predictions of the tracer breakthrough concentrations and times being within an order of magnitude of the observations. Also the AEA and Golder approaches allow the spatial distribution of tracer breakthrough into the validation drift to be predicted and these predictions also showed reasonable accuracy. The successful completion of this project demonstrates the feasibility of discrete fracture flow and tracer transport modelling. (36 refs.) (au).

1621 (STRIPA-TR–92-21) **Final report of the rock sealing project. Sealing of zones disturbed by blasting and stress release.** Boergesson, L. (Clay Technology AB, Lund (Sweden)); Pusch, R.; Fredriksson, A.; Hoekmark, H.; Karnland, O.; Sanden, T. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Apr 1992. 156p. Order Number DE93603602. Source: OSTI; NTIS; INIS.

Test 2 and 3 of the rock sealing project comprised determination of the hydraulic properties of the disturbed rock around tunnels and drifts and the possibilities of decreasing the hydraulic conductivity of the disturbed zones by an attempt to seal the very fine excavation-induced fractures that cause an increase in conductivity. This report deals with the grouting procedures and their effect while the hydraulic testing before grouting is described in volume 2. The macro flow test of the BMT drift before grouting showed that the disturbed zone around the drift has a highly increased hydraulic conductivity reaching more than 1 m into the rock from the periphery of the drift. The most conductive shallow part of this zone was grouted by 350 1 m long 'hedgehog' holes. The holes were injected with cement using dynamic as well as static techniques. The injections were preceded by laboratory investigations of the rheological properties of different cement mixtures, by theoretical modelling of grout penetration in factures, and by full scale injections in an artificial fracture. The macro flow test was repeated after the grouting and the results evaluated by using the same finite element models as before the grouting. The conclusion was that the effect of the grouting was very small. Excavation of the rock after grouting showed that the grout penetration has been very poor into chlorite-coated fractures and a conclusion was that such fractures are hardly groutable due to debris hindering the grout from penetrating. (au).

1622 (STRIPA-TR–92-22) **Site characterization and validation - Final report.** Olsson, O. (ed.) (Conterra AB, Uppsala (Sweden)). Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Apr 1992. 412p. Order Number DE93603603. Source: OSTI; NTIS; INIS.

The central aims of the Site Characterization and Validation (SCV) project were to develop and apply; * an advanced site characterization methodology and * a methodology to validate the models used to describe groundwater flow and transport in fractured rock. The basic experiment within the SCV project was to predict the distribution of water flow and tracer transport through a volume of rock, before and after excavation of a sub-horizontal drift, and to compare these predictions with actual field measurements. A structured approach was developed to combine site characterization data into a geological and hydrogeological conceptual model of a site. The conceptual model was based on a binary description where the rock mass was divided into 'fracture zones' and 'averagely fractured rock'. This designation into categories was based on a Fracture Zone Index (FZI) derived from principal component analysis of single borehole data. The FZI was used to identify the location of fracture zones in the boreholes and the extent of the zones between the boreholes was obtained form remote sensing data (radar and seismics). The consistency of the geometric model thus defined, and its significance to the flow system, was verified by cross-hole hydraulic testing. The conceptual model of the SCV site contained three major and four minor fractures zones which were the principal hydraulic conduits at the site. The location and extent of the fracture zones were included explicitly in the flow and transport models. Four different numerical modelling approaches were pursued within the project; one porous medium approach, two discrete fracture approaches, and an equivalent discontinuum approach. A series of tracer tests was also included in the prediction-validation exercise. (120 refs.) (au).

1623 (STRIPA-TR–92-26) **The Stripa project annual report 1991.** Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). May 1992. 192p. Order Number DE93603604. Source: OSTI; NTIS; INIS.

The Stripa project is an international project being performed under the sponsorship of the OECD Nuclear Energy Agency (NEA). The project concerns research related to the disposal of highly radioactive waste in crystalline rock. The Research and Development Division of the Swedish Nuclear Fuel and Waste Management Company (SKB) has been entrusted with the management of the project, under the direction of representatives from each participating country. The aim of this report is to inform the OECD Nuclear Energy Agency and the participants in the project about the general progress of work during 1991.

1624 (YMP-SELV–88/1990) **Methodology for detecting potentially contaminated soil sites: Preliminary study.** Assmuth, T. (National Board of Waters and the Environment, Helsinki (Finland)); Laeaeperi, O.; Strandberg, T.; Suokko, T. Ministry of the Environment, Helsinki (Finland). Environmental Protection Dept. 1990. 120p. (In Finnish). Order Number DE93711145. Source: OSTI; NTIS.

A preliminary study has been made of information sources and methods for the identification and assessment of chemically contaminated soil sites. A pilot survey of potential contaminated sites was carried out in three municipalities. The study includes an overview of the problems and activities within the field of contaminated soil sites in Finland and in some foreign countries. A short overview was presented of the methods applied in investigation and assessment of contaminated soil sites. On the basis of the preliminary survey, a rough evaluation was made of the magnitude and characteristics of the problems related to contaminated soil sites in Finland. Future needs in site inventories and investigations were outlined and recommendations were given for their conduct.

1625 (BNL–47937) **Estimating phytoplankton photosynthesis by active fluorescence.** Falkowski, P.G.; Kolber, Z. Brookhaven National Lab., Upton, NY (United States). [1992]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9204164–2: International symposium on the measurement of primary production from the molecular to global scale, La Rochelle (France), 19-26 Apr 1992). Order Number DE93000369. Source: OSTI; NTIS; GPO Dep.

Photosynthesis can be described by target theory, At low photon flux densities, photosynthesis is a linear function of irradiance (I), The number of reaction centers (n), their effective absorption capture cross section σ, and a quantum yield ϕ. As photosynthesis becomes increasingly light saturated, an increased fraction of reaction centers close. At light saturation the maximum photosynthetic rate is given as the product of the number of reaction centers (n) and their maximum electron transport rate ($1/\tau$). Using active fluorometry it is possible to measure non-destructively and in real time the fraction of open or closed reaction centers under ambient irradiance conditions in situ, as well as σ and $\phi\,\tau$ can be readily, calculated from knowledge of the light saturation parameter, I_k (which can be deduced by in situ by active fluorescence measurements) and σ. We built a pump and probe fluorometer, which is interfaced with a CTD. The instrument measures the fluorescence yield of a weak probe flash preceding (f_0) and succeeding (f_0) a saturating pump flash. Profiles of the these fluorescence yields are used to derive the instantaneous rate of gross photosynthesis in natural phytoplankton communities without any incubation. Correlations with short-term simulated in situ radiocarbon measurements are extremely high. The average slope between photosynthesis derived from fluorescence and that measured by radiocarbon is 1.15 and corresponds to the average photosynthetic quotient. The intercept is about 15% of the maximum radiocarbon uptake and corresponds to the average net community respiration. Profiles of photosynthesis and sections showing the variability in its composite parameters reveal a significant effect of nutrient availability on biomass specific rates of photosynthesis in the ocean.

1626 (BNL–47941) **Measurement of carbon and nitrogen biomass, and biovolume from naturally derived marine bacterioplankton.** Lee, SangHoon. Brookhaven National Lab., Upton, NY (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93000371. Source: OSTI; NTIS; GPO Dep.

Bacterial production often needs to be presented in carbon or nitrogen biomass. Conversions to such universal units are particularly necessary to interpret the data in terms of energy or material flow in relation to other trophic groups of organisms. For field applications, bacterial biomass is routinely estimated from cell concentrations or cell volumes (biovolume) with appropriate conversion factors. For the direct determination of a conversion factor, in principle, three independent parameters are measured; number of cells, biovolume of the cells, and biomass. Current methods for all of those three are subject to potential errors. Described here is a method that combines the acridine orange (AO) direct count method for cell enumeration, AO epifluorescence photomicrography for the biovolume measurement, and CHN analysis for C and N biomass. This method offers several improvements including bacterial cells are derived from natural seawater and grown in unsupplemented natural seawater; corrections are made for the bacterial cells passing through glass fiber GF/F filters; and biovolume measurement is calibrated with fluorescent microspheres of known diameters.

1627 (CONF-9209228–1) **Size-dependent vulnerability of marine fish larvae to predation: An individual-based numerical experiment.** Cowan, J.H. Jr. (University of South Alabama, Mobile, AL (United States). Dept. of Marine Sciences); Houde, E.D.; Rose, K.A. Oak Ridge National Lab., TN (United States). [1992]. 17p. Sponsored by USDOE, Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. Grant OCE-8701304;Contract RP2932-2. From 80. statutory meeting of the International Council for the Exploration of the Sea; Wassermunde (Germany); 24 Sep 1992. Order Number DE93000437. Source: OSTI; NTIS; INIS; GPO Dep.

An individual-based predation model permitted 20-d simulations to be initiated with populations of individual "theoretical" ctenophore-, medusae-, and planktivorous fish-like predators and larvae prey that varied in size, growth rate, and swimming speed

similarly to populations in the field. Results of predation experiments in 3.2 M^3 mesocosms were used to estimate parameters in a Gerritsen-Strickler type encounter model which is embedded into the individual-based framework. Larval susceptibility with size also was estimated for each predator. Model simulations indicate that the relationship between larval size and vulnerability to predation, and ultimately cohort survival rate, depends upon attributes both of individual predators and larval prey and that bigger or faster growing larvae within a cohort are not always most likely to survive. Despite the finding that cohort-specific mortality generally decreased as the mean size (length) of the members of the cohort increased, mean size or growth rate of individual surviving larvae each day was lower or not significantly different from those that died in most simulations until larvae reached a size threshold when susceptibility decreased more rapidly with larval size than encounter rate increased. After the size threshold was reached, a "switch" occurred whereby predation began to select for survivors of longer mean length. The time necessary to reach the threshold depends on growth rate of the larvae, size of the predators and the variance structure of these parameters.

1628 (DOE/BP–01830-12) **Supplementation in the Columbia Basin, Part 1: Rasp summary report series, background, description, performance measures, uncertainty, and theory.** USDOE Bonneville Power Administration, Portland, OR (United States). Div. of Fish and Wildlife. May 1992. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92040785. Source: OSTI; NTIS; GPO Dep.

This progress report broadly defines the scope of supplementation plans and activities in the Columbia Basin. It provides the foundation for more detailed analysis of supplementation in subsequent reports in this series. Topics included in this report are: definition of supplementation, project diversity, objectives and performance standards, uncertainties and theory. The supplementation theory will continue to evolve throughout the duration of Regional Assessment of Supplementation Project (RASP) and beyond. Supplementation is expected to be a major contributor to the planned increase in salmon and steelhead production in the Columbia Basin. The Fish and Wildlife Program of the Northwest Power Planning Council (NPPC) uses three approaches to protect and enhance salmon and steelhead in the Columbia Basin: (1) enhance fish production; (2) improve passage in the mainstream rivers; and (3) revise harvest management to support the rebuilding of fish runs (NPPC 1987). The fish production segment calls for a three-part approach focused on natural production, hatchery production, and supplementation. Supplementation is planned to provide over half of the total production increases.

1629 (DOE/BP/50301–3) **Biological manipulation of migration rate: The use of advanced photoperiod to accelerate smoltification in yearling chinook salmon, 1990: Annual report of research.** Muir, W.D.; Zaugg, W.S.; McCutcheon, S.; Williams, J.G. National Marine Fisheries Service, Seattle, WA (United States). Coastal Zone and Estuarine Studies Div. Jun 1992. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI79-88BP50301. Order Number DE92040929. Source: OSTI; NTIS; GPO Dep.

Research was conducted during 1990 to assess the feasibility of biologically manipulating physiological development and migratory behavior of yearling spring chinook salmon, Oncorhynchus tshawytscha. At Dworshak National Fish Hatchery, one treatment group was exposed to a 3-month advanced photoperiod schedule for 13 weeks preceding release to accelerate smolt development. Another group was exposed to the same advanced photoperiod schedule, but additionally was reared at an elevated water temperature (11.9°C) for 10 days prior to release. At Leavenworth National Fish Hatchery, a treatment group was exposed to a 3-month advanced photoperiod schedule for 17 weeks. Gill Na^+-K^+ATPase development and migratory performance were described for all groups. The treated fish which were the most physiologically advanced at release were detected in the highest proportions at collector dams and also migrated fastest downstream–similar to results obtained in 1988 and 1989.

1630 (DOE/ER/60628–3) **Utilization, cycling and vertical transport of particulate organic matter in the coastal marine environment: Final project report, November 15, 1987–May 14, 1992.** Landry, M.R. Hawaii Univ., Honolulu, HI (United States). Dept. of Oceanography. [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER60628. Order Number DE93000897. Source: OSTI; NTIS; GPO Dep.

This project was funded as part of the California Basin Study (CaBS), a DOE-funded regional program investigating production, cycling, transport, and fate of organic matter, chemical tracers, and pollutants in the Southern California Bight. The study area, adjacent to Los Angeles, was of programmatic interest due to its heavy concentration of energy-related activities, including offshore oil drilling and natural seeps, shipping, nuclear power facilities, and industrial and municipal ocean waste disposal. It was also of scientific interest because the wide continental margin in the region, pot-marked with natural sediment traps in the form of deep basins with restricted inputs and outputs, was ideal for integrating water-column and benthic studies and tracing the fates of in situ production and introduced pollutants. Our role in the CABS Program was to investigate the flux of particulate matter through the water column, emphasizing the relationship between macrozooplankton feeding and particle flux.

1631 (DOE/ER/60946–3) **Reductive mobilization of oxide-bound metals: Progress report, September 15, 1991–September 15, 1992.** Stone, A.T. Johns Hopkins Univ., Baltimore, MD (United States). Dept. of Geography and Environmental Engineering. [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER60946. Order Number DE93003159. Source: OSTI; NTIS; INIS; GPO Dep.

This project is concerned with the mobilization of MnO_2- and FeOOH-bound toxic metals in subsurface environments arising from an influx of natural organic matter or organic-containing wastes. Our work to date emphasizes the importance of characterizing the reductant, complexant, and adsorptive characteristics of constituent organic chemicals. Organic chemicals may interact with pollutant metals directly, or may bring about changes in speciation and solubility indirectly by acting upon MnO_2 and FeOOH host phases. The primary application of this work is the understanding of metal sorption and release processes within subsurface environments undergoing changes in redox status.

1632 (DOE/ER/61223–1) **Scientific development of a massively parallel ocean climate model: Progress report, 1991–1992.** Semtner, A.J. Jr. (Naval Postgraduate School, Monterey, CA (United States)); Chervin, R.M. Naval Postgraduate School, Monterey, CA (United States); National Center for Atmospheric Research, Boulder, CO (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-91ER61223. Order Number DE92040508. Source: OSTI; NTIS; GPO Dep.

A thorough examination was made of existing results from the global ocean model with high resolution. Additional experiments were chosen to help investigate the sensitivity of global ocean circulation and its associated transports of heat and salt to proposed changes in high-latitude buoyancy forcing and wind forcing.

1633 (DOE/ER/61224–1) **Scientific development of a massively parallel ocean climate model: Progress report for 1991–1992 and Continuing request, 1992–1993 to CHAMMP (Computer Hardware, Advanced Mathematics, Model Physics).** Semtner, A.J. Jr. (Naval Postgraduate School, Monterey, CA (United States)); Chervin, R.M. Naval Postgraduate School, Monterey, CA (United States); National Center for Atmospheric Research, Boulder, CO (United States). Mar 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-91ER61224. Order Number DE92040517. Source: OSTI; NTIS; GPO Dep.

Experiments to investigate the sensitivity of global ocean circulation and its associated transports of heat and salt to proposed changes in high-latitude buoyancy forcing and wind forcing. An experiment was designed to improve the representation of water-mass production in areas of known deep-water formation. At the same time, almost all of the deep and abyssal regions of the world

ocean were freed from earlier restoring to observed values of temperature and salinity. This convective forcing experiment has been run on the NCAR Y-MP/864 for three years of a planned five-year sensitivity study.

1634 (ETDE-IT–92-84) **Porto Tolle thermoelectric power station and aquatic environment of Po Delta (Italy): Synthesis of data.** Ambrogi, R. Ente Nazionale per l'Energia Elettrica, Milan (Italy). Centro Termica e Nucleare. 1990. 26p. (In Italian). Order Number DE93729445. Source: OSTI; NTIS (US Sales Only); INIS.

The 2400 MW, oil-fueled power station of Porto Tolle (Italy) potentially affects riverine, lagoon and marine sectors of the Po Delta. A synthesis is provided of the data gathered by several research lines, which studied different aspects of the environment during the pre-operational and operational period. Comparisons are made between the two periods and between stations more or less influenced by cooling water discharge. When river water is used for cooling (the majority of cases), some effects on water quality characteristics and on plankton community abundances are evident in the immediate vicinity of the outlet. In the lagoon (Sacca del Canarin) and in the stretch of sea in front of it, effects directly connected with the thermal effluent could not be detected. The geomorphological evolution of the lagoon, however, was influenced by the hydraulic modification brought about by the cooling circuit. This resulted in an enhancement of the biological production of the lagoon. The sea area is not affected in a significant way, but concern is raised about the interaction of cooling discharge and the eutrophic load from the Po River.

1635 (ETDE-IT–92-90) **Marine environment indicators and indices: Use of macrobenthos.** Ambrogi, R.; Occhipinti Ambrogi, A. Ente Nazionale per l'Energia Elettrica, Milan (Italy). Centro Termica e Nucleare; Pavia Univ. (Italy). Ist. di Genetica. 1991. 44p. (In Italian). Order Number DE93729478. Source: OSTI; NTIS (US Sales Only); INIS.

In marine environmental impact studies the macrobenthos can be used successfully in order to establish indicators and indices and to construct environmental quality functions. The body of knowledge gathered on Mediterranean benthic communities is used to emphasize the role of 'characteristic' species in describing well defined environmental conditions. The structural indices, even the simplest and commonest ones, can give a first insight of the disturbance intensity. In particular, indices based on species, abundance and biomass curves are described, in addition to those based on the log-normal distribution of individuals among species and those derived from the method of abundance-biomass comparison.

1636 (FEMP/SUB–055) **Electrofishing survey of the Great Miami River, September 1991: Annual report.** Miller, M.C. (Cincinnati Univ., OH (United States). Dept. of Biological Sciences); Ross, L.S.; Bixby, R.; Engman, J.; Gutierrez, F.; Perry, W. Westinghouse Environmental Management Co. of Ohio, Cincinnati, OH (United States). Fernald Environmental Management Project; Cincinnati Univ., OH (United States). Dept. of Biological Sciences. Aug 1992. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-86OR21600. Order Number DE93001261. Source: OSTI; NTIS; INIS; GPO Dep.

This 1991 report is a continuation to our report on the status of the fishery of the Great Miami River in September 1990. The fisheries analysis contained in this report focuses on the areas that are upstream of the Fernald Environmental Management Project (FEMP) outfall line, and those sites downstream of the outfall potentially impacted by FEMP effluents. Fish were collected by electroshocking. The fish were identified to species, weighed, measured; their gender was determined and external abnormalities are noted. Modified filets and remaining parts are frozen for shipment to the specified lab.

1637 (INIS-GB–446) **Annual report on radioactive discharges from Winfrith and monitoring the environment 1990.** AEA Technology, Winfrith (United Kingdom). Jun 1991. 56p. Order Number DE93605434. Source: OSTI; NTIS (US Sales Only); INIS.

This annual report, the sixth of its type, aims to provide full information on discharges and environmental monitoring. The report is mainly graphical, comparing past and current levels with authorised limits, derived limits or the recommended limits of the International Commission on Radiological Protection (ICRP). All the data are presented at the end of the report in tabular form. Discharges from Winfrith are subject to Authorisations issued jointly by the Department of the Environment (DOE) and the Ministry of Agriculture, Fisheries and Food (MAFF). The numerical values of the Authorised Limits are based on past performance, future requirements and the application of Best Practicable Means (BPM). As a "back stop", discharges at the limits must not result in doses to the most potentially exposed part of the local population - the critical group - exceeding 0.5 mSv per year. The limit recommended by the International Commission on Radiological Protection (ICRP) for dose to a member of the general public is 1.0 mSv per year. In September 1990 Winfrith's Steam Generating Heavy Water Reactor (SGHWR) was shut down and a decision taken, later, that reactor operation would cease. The pattern of discharges thus changed in the last quarter of the year and discharges in future will be lower, and of a different pattern, than those of the past twenty years. The dose to the critical group, which is already less than 2% of the ICRP limit and less than 1% of the UK average natural background dose will drop further in future years. (Author).

1638 (INIS-mf–13371) **IOC-UNEP review meeting on oceanographic processes of transport and distribution of pollutants in the sea.** IOC workshop report. United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France). Intergovernmental Oceanographic Commission (IOC). 1991. 29p. (CONF-9105381–: IOC-United Nations Environment Programme (UNEP) review meeting on oceanographic processes of transport and distribution of pollutants in the sea, Zagreb (Yugoslavia), 15 May 1991). Order Number DE93605070. Source: OSTI; NTIS (US Sales Only); INIS.

The IOC-UNEP Review Meeting on Oceanographic Processes of Transfer and Distribution of Pollutants in the Sea was opened at the Ruder Boskovic Institute, Zagreb, Yugoslavia on Monday, 15 May 1989. Papers presented at the meeting dealt with physical and geochemical processes in sea-water and sediment in transport mixing and dispersal of pollutants. The importance of mesoscale eddies and gyres in the open sea, wind-driven currents and upwelling events in the coastal zone, and thermohaline processes in semi-enclosed bays and estuaries was recognized. There is strong evidence that non-local forcing can drive circulation in the coastal area. Concentrations, horizontal and vertical distributions and transport of pollutants were investigated and presented for a number of coastal areas. Riverine and atmospheric inputs of different pollutants to the western Mediterranean were discussed. Reports on two on-going nationally/internationally co-ordinated projects (MEDMODEL, EROS 2000) were presented. Discussions during the meeting enabled an exchange of ideas between specialists in different disciplines to be made. It is expected that this will promote the future interdisciplinary approach in this field. The meeting recognized the importance of physical oceanographic studies in investigating the transfer and distribution of pollutants in the sea and in view of the importance of the interdisciplinary approach and bilateral and/or multilateral co-operation a number of recommendations were adopted.

1639 (INIS-mf–13371, pp. 16) **River versus atmospheric inputs to the Western Mediterranean: Annex 3.** Martin, J.M. United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France). Intergovernmental Oceanographic Commission (IOC). 1991. 1640 (KFK-PWAB–9) **Test field water/soil. Sub-project II: Pollutant transport in underground strata, methods of detection and monitoring. 1. Project phase. Final report.** Hofmann, B. (Stuttgart Univ. (Germany). Inst fuer Wasserbau); Kobus, H.; Ptak,

T.; Schad, H.; Teutsch, G. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Wasser-Abfall-Boden (PWAB). Oct 1991. 128p. (In German). Order Number DE93720173. Source: OSTI; NTIS (US Sales Only).

This research report contains the results of the first project phase (1.7.87 - 28.2.91) of the subproject of the Institute for Hydraulic Engineering. Chapter 2 gives an overview of the research programme. Chapters 3 and 4 explain the test field infrastructure and the measuring systems (laboratory and field measuring equipment) specially designed for it. Measuring methods, results and first evaluations are summarized in chapter 5. Further analysis of data with geostatic methods and the subsequent stochastic numerical simulation of groundwater flow- and transport processes are described in chapters 6 and 7. (orig.).

1641 (NKS-RAD–2-91-2) **Algae as bioindicators for radionuclides in Nordic coastal waters: Summary of discussions and abstracts of papers.** Neumann, G. (Swedish Environmental Protection Agency (Sweden)); Notter, M. Nordisk Kernesikkerhedsforskning, Roskilde (Denmark). 1991. 27p. (CONF-9010509–: Seminar on algae as bioindicators for radionuclides in Nordic coastal waters, Forsmark (Sweden), 16 Oct 1990). Order Number DE93605435. Source: OSTI; NTIS; INIS.

During the later part of the 1970's NKS decided to introduce the bladder wrack (Fucus vesiculosus) as a suitable organism for monitoring radionuclides in Nordic coastal waters. During the past few years studies on this subject have been going on to a varying extent in the different Nordic countries. At this miniseminar the participants described different ongoing studies and projects. The lectures are summarized in the abstracts in the appendix, in which the speakers themselves are responsible for their contributions. (au).

1642 (RFP–4553) **Remote surface water monitoring.** Baxter, D.; Goodwin, W. EG and G Rocky Flats, Inc., Golden, CO (United States). [1992]. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. (CONF-9209203–1: Environmental professionals meeting, Park City, UT (United States), 9-11 Sep 1992). Order Number DE92040779. Source: OSTI; NTIS; INIS; GPO Dep.

The Surface Water Division (SWD) and the Environmental Technologies Group (ET) have teamed up to create a complete remote surface water monitoring system based on new technologies in microelectronics and the environmental sciences. Careful evaluation of these new technologies has resulted in the design and installation of a working system that is easily installed, cost-effective and reliable. Rocky Flats Plant (RFP) is part of the Department of Energy weapons complex. Because of its location upstream of the Denver, Colorado, Metropolitan area, the plant is required by law and interagency agreements to adhere to strict specifications for surface water monitoring and discharge, including the requirement for utilization of best available technology. RFP now has a successful remote surface water monitoring system. This system was developed by a team of result-oriented people with strong electronics backgrounds and many years of experience in instrumentation, microprocessors, and the environmental sciences. Even after implementation of the system, the team continues to seek out and test components that fit into the system and that also meet or exceed the strict system requirements. The systematic approach used in development made it possible to exceed regulatory requirements while maintaining accurate field data.

1643 (SA-PUB–9/89-Vol.1, pp. 51-62) **Variations of the sea temperature around the coasts of Finland.** Alenius, P. (Finnish Institute of Marine Research, Helsinki (Finland)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

Considerable interest in the variability of temperature and salinity in the Baltic Sea has been shown during this decade. Studies of seasonal and long term variations of temperature and salinity near the Finnish coasts has been published. Those studies have used time series from hydrographic stations available since early 1900's. This study continues those studies. The variations in the seasonal temperature cycle as well as variations in the thermal stratification are studied. The character of the changes between different decades of this century are described. Also the trends in temperature and ice conditions are compared.

1644 (SA-PUB–9/89-Vol.1, pp. 63-72) **On climatic variations of the baltic sea ice conditions.** Leppaeranta, M. (Finnish Institute of Marine Research, Helsinki (Finland)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

The Baltic Sea is located in the seasonal sea ice zone of the world ocean where climatic variations show up drastically in the characteristics of ice seasons. The freezing and break-up dates range 2-3 months in a fixed location. The paper presents results of a time series analysis of Baltic Sea ice observations. The length of the time series is 70-156 years, and they describe the freezing and break-up dates and ice thickness along the Finnish coast. A slight general trend towards milder ice seasons is present. A first order analytic analysis is carried through to see how the ice season characteristics depend on the course of the air temperature. The results are further used to examine the climatic warming effect to the Baltic Sea ice season.

1645 (SA-PUB–9/89-Vol.1, pp. 121-137) **The Mediterranean oscillation: impact on precipitation and hydrology in Italy.** Conte, M. (Servizio Meteorologico dell Aeronautica, Rome (Italy)); Giuffrida, A.; Tedesco, S. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

An analysis is carried out of the 500 hPa height over the Mediterranean since 1946 by using, as guide stations, Alger and Cairo, representative sites, respectively, of the western basin and of the eastern one. Such analysis is mainly performed on the annual values. High positive correlation coefficients are found out among the 500 hPa heights of Alger and the ones of other sites in the central and western Mediterranean; on the contrary, negative correlation coefficients are pointed out among the values of Alger and the corresponding ones of localities of the eastern Mediterranean, in particular Cairo. An oscillatory increase of the 500 hPa height at Alger is quite evident from the analysis, in exact phase-opposition with an oscillatory decrease of the height at Cairo.

1646 (SA-PUB–9/89-Vol.1, pp. 138-148) **Effect of climate change on evaporation and water temperature.** Jurak, D. (Institute of Meteorology and Water Management, Warsaw (Poland)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

A methodology for the assessment of climate impacts on shallow (non-stratified) aquatic bodies is presented. The model is aimed to calculate the water temperature, heat exchange characteristics and evaporation losses using standard meteorological data. It was extensively tested for the present climate conditions and used for calculating thermal regime and free-water evaporation for a number of lakes and reservoirs in Poland. Assuming GCMs-based changes of climatic parameters under the hypothesis of CO_2 doubling, calculations of T and E were done for three locations in Poland with differentiated climatic conditions. The results show that for the mid-altitude regions the mean monthly temperature of water may rise from 0.9 deg C to 1.5 deg C, depending on the month. Evaporation values will increase from 14 % to 19 %. CO_2 doubling may greatly influence the seasonal distribution of energy and water balance of water bodies, and consequently change their physical, biological and chemical properties.

1647 (SA-PUB–9/89-Vol.2, pp. 7-27) **The impact of climatic change on the aquatic environment.** Beran, M. (Institute of Hydrology, Wallingford (GB)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

The paper is a survey of methods for integrating the immediate effects of climatic change on hydrological variables to consider the impact on the physical, chemical and biological properties of water bodies; and consequences to water supply, waste disposal, human health, and the viability of aquatic ecosystems. Aquatic environments that are considered include rivers and lakes, bogs, marshes, tundra and deltas and their responses to changes in climate and carbon dioxide. Related practical problems are considered in the field of fisheries, water pollution, conservation, and human diseases. By contrast with quantitative aspects of hydrology and water resources, few authors have attempted to evaluate the impact of climatic change on qualitative aspects. The prime objects of this paper are therefore to review information sources on climate sensitivity in the aquatic environment, and to encourage relevant impact and other studies by experts in water quality and aquatic ecology.

1648 (SA-PUB–9/89-Vol.2, pp. 28-36) **The impact of precipitation variability on the quality of running waters.** Simeonidis, A. (Uppsala Univ. (Sweden). Div. of Hydrology). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

Physico-chemical data obtained for the period 1965-1986 have been used to investigate time variations of substance transports in the river Fyris within Uppsala County, Sweden. Substance transports have been calculated for the elements of phosphorous, nitrogen and organic matter measured as COD-Mn. The yearly substance transport series shows a significant change about the year 1976. After this year the transport increases for all three elements having decreased since 1967. The substance transport series well follows the precipitation variability as shown in the yearly precipitation sums. The precipitation data were from a station within the river Fyris drainage basin. Further, average yearly concentrations were investigated for each element. Nitrogen concentrations increased steadily until 1976 while phosphorous and COD-Mn decreased during the same period. After this year changes in concentrations were only moderate. It is concluded that the increase of the elements after 1976 is due to increase in precipitation amounts.

1649 (SA-PUB–9/89-Vol.2, pp. 68-78) **Vegetation, water and climatic change.** Mandych, A.F. (Institute of Geography, Moscow (USSR). Dept. of Methodology of Geosystems Study). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

With climatic change, transformation of the vegetation cover will not be only due to increase or decrease of bioclimatic temperatures but probably due to alternation of water behaviour and soil erosion rate. This can lead to drastic changes the bases of present vegetation existence.

1650 (SA-PUB–9/89-Vol.2, pp. 43-67) **Climate induced hydrological shifts in Europe and their implication spectrum - unique opportunity to strengthen hydrology.** Falkenmark, M. (Natural Science Research Council, Stockholm (Sweden)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

Climate change will be felt by society first through water-related phenomena. The wettening of European land may change considerably with wetter conditions in the North and drier in the South. Considerable growing period shifts may perturbate European agricultural patterns, increasing the growing season in the North but creating drought problems in the South. Water availability may grow scarce in the South, causing large water management problems when higher demand from agriculture has to be met under increased water stress. Climate change implications for well-organized European societies should not be underestimated. Most sectors of society will feel changes, and have to meet increasing costs for adaptation measures. The result may include an all-time-high in the demand for hydrological consultancy. Timely policy responses will be crucial for adaptation/mitigation but will depend on the development of improved ways of communication between scientists and policy-makers. The organization of policy workshops, and the use of matrices to transfer messages on interdependent phenomena might be useful components. The considerable implications of the climate change, propagated through the water cycle, will create large research needs, particularly on the interaction water-soil-vegetation, water quality genesis changes, influence of hydrological shifts on land use, methods for early warning by use of hydrological indicator systems, and assessment of expected changes in the hydrology and freshwater exchange of the Baltic with secondary consequences on the marine biology of the system. Climate change will provide a unique opportunity to strengthen and renew hydrology, defending its position as one of the major geosciences.

1651 (SA-PUB–9/89-Vol.2, pp. 100-113) **Non-point source pollution from irrigated watersheds: An assessment and management with regard to climatic changes.** Belyaeva, T. (Water Problems Institute of the USSR Academy of Sciences, Moscow (USSR)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

An assessment of irrigation impacts on water quality with regard to alternative economic development strategies is considered as a part of a general problem of regional water and land resources management under changing climate. The assessment of irrigation pollution consists of several stages: an assessment of unit loads of pollutants from agricultural watersheds according to land use type taking into account varied levels of precipitation, evapotranspiration and runoff under considered climatic scenarios; an assessment of total pollutant export from a basin for various climatic scenarios and economic development strategies implementing optimization modelling technique for land and water resources allocation in agricultural sector; conservation management of water and land sources use and pollution control according to established environmental constraints. The final stage is an iterative process aimed at reaching established water quality standards by means of land and water resources reallocation, technological shifts in crop production and irrigation methods. A comparative analysis of various strategies of economic development in an irrigated region (the Northern Caucasus area of the European USSR is used for a case study) helps to select the optimal ways of production, technological and environmental targets achievement with regard to future global and regional climatic changes.

1652 (SA-PUB–9/89-Vol.2, pp. 114-127) **Impacts of climatic changes on hydrology and water resources of coastal zones.** Volker, A. (IHP- National Committee, Westlaan (Netherlands)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

The present notes are dealing with the impacts of climatic changes on the hydrology and water resources of coastal zones. Emphasis will be on deltaic and other low-lying coastal areas such as lagoon areas and coastal marshes. Attention will be focused on Europe with landscapes in mind like the deltas of the Vistule (Poland), the Rhine and Meuse (Netherlands), the Ebro (Spain), the Rhone (France), the Danube (Romania) and low-lying coastal areas of Denmark, east-coast of England, north-western coast of Federal Germany, west-coast of France.

1653 (SA-PUB–9/89-Vol.2, pp. 128-147) **Impact of sea level rise on coastal zone management in Southern Sweden.** Lindh, G. (Lund Univ. (Sweden). Dept. of Water Resources Engineering); Hanson, H.; Larson, M. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

One consequence of the greenhouse effect is sea level rise. It is expected that this phenomenon will increase erosion along coastal reaches used for recreation as well as increase saltwater intrusion affecting water supply from wells located near the coast. These two

problems may in the long run create a renewed attitude to long-term planning, development, and decision-making both on a local and regional level. In this paper the problems of beach erosion and saltwater intrusion caused by sea level rise is discussed for regions in southern Sweden. Remedial measures in order to meet an increased erosion are presented and their ability to function during an increase in water level is examined. It is difficult to give recommendations about the most appropriate method to be used, since the consequences of the greenhouse effect will appear gradually at a rather slow rate. However, the main object of the paper is to create an awareness among people involved in coastal zone planning and management of coming climatic changes and its possible impacts.

1654 (SA-PUB–9/89-Vol.2, pp. 148-160) **The impact of climate change on coastal zone management in Britain: A preliminary analysis.** Coker, A.M. (Middlesex Polytechnic Flood Hazard Research Centre, Enfield (GB)); Thompson, P.M.; Penning-Rowsell, E.C.; Smith, D.I. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

The impact of climate change on coastal zone resources and management in Britain could be profound. Recent research and analysis indicates that the extent of areas affected could be substantial, although the uncertainty in these predictions remains large. This paper reviews the latest of these predictions and gives an assessment of the extent of the consequential 'threat' from sea level rise. In addition it evaluates a number of the impacts from such a sea level rise, including the effect on storm surge heights and on the warnings of flooding and erosion losses that would ensue. A number of examples are used to evaluate the variety, extent and degree of many of the possible socio-economic and environmental impacts, and a methodology for assessing the economic impacts in more detail is outlined, based on previous research on flooding and erosion impacts. Finally some conclusions are drawn about the possible policy implications of the sea level rise phenomenon and its likely impacts.

1655 (SA-PUB–9/89-Vol.2, pp. 161-176) **The impacts of climate variability and change on urban and industrial water supply and waste water disposal.** Kaczmarek, Z. (International Institute for Applied Systems Analysis, Laxenburg (Austria)); Kindler, J. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

The paper concentrates on the assessment of possible consequences of present and future climate variability of climatic characteristics on urban water supply and demand. The stability of climate and hydrology is up to now a central concept in water resources planning and decisions are being made on the assumption that future water supply will be much like the past. Since the mid-seventies scientists and - unfortunately - to a lesser extent decision makers have agreed that this is no longer a good assumption. Water managers have to use the new hydrologic estimates to evaluate the performance of water resource systems under changing climatic conditions. In spite of still existing uncertainties in climate predictions there is a need for new approaches to water resources planning to make supply systems more resilient and robust.

1656 (SA-PUB–9/89-Vol.2, pp. 177-190) **Identifying the climate-sensitive segment of British reservoir yield.** Law, F.M. (Institute of Hydrology, Wallingford (GB). Engineering Hydrology Division). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

The role of a reservoir is to balance flows over a drought period using storage to cover cumulative deficits in meeting demand. Those flows originate from both prior climate as baseflow and from current climate as rapid response runoff. Recognising the relative contribution of each segment of yield gives a fundamental understanding that can be used to determine the scope that climate change has to vary yield. The paper summarises the historical development of the dominant UK water supply yield estimation method which concentrates on the total drought flow that can be relied on for a chosen level of risk (normally the once-in-fifty year event). Results from such analyses are best compared using dimensionless yield-storage 'curves' and noting on them the critical drought durations that have determined each straight line sector of those curves.

1657 (SA-PUB–9/89-Vol.2, pp. 191-206) **Impact of greenhouse effect on sewerage systems.** Nirczynowicz, J. (Lund Univ. (Sweden). Dept. of Water Resources Engineering). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

The possible impacts of modification in rainfall pattern due to greenhouse effect on the function of the sewerage system is studied based on a case study of the city of Lund and Malmoe. The Storm Water Management Model is used to simulate changes in runoff pattern. The paper lists possible effects of increase in rainfall intensity on the urban water cycle, quantifies changes in runoff pattern and discusses significance of detected changes in terms of economical and environmental consequences and the possibilities to undertake preventative measures. For the purpose of the present study, the 10 %, 20 % and 30 % levels of rainfall increase was assumed. Given examples of possible impacts of the greenhouse effect on the function of the sewage system, in spite of considerable uncertainty regarding the potential future rate of hydrological changes, bear witness to the grate vulnerability of sewerage systems to results of climate changes.

1658 (SA-PUB–9/89-Vol.2, pp. 237-244) **Effects of climate variation of public water supply.** Goma, W. (Central Forecast Office, Lusaka (Zambia). Dept. of Meteorology). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

The paper looks at climate variation over the last 50 years period from 1937 - 1988. Also, is to search for similar pattern in weather fluctuation. Secondly, is to access if there has been any effect of climate variation on public water supply in Zambia.

1659 (SKB-TR–91-57) **The groundwater circulation in the Finnsjoe area - the impact of density gradients. Part A, B, C.** Ahlbom, K. (Conterra AB, Uppsala (Sweden)); Svensson, U. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Nov 1991. 83p. Order Number DE93605444. Source: OSTI; NTIS; INIS.

Saline groundwater is found in many boreholes at the Finnsjoen site. The occurrences and depths to the saline water vary however greatly between different boreholes. This report presents a conceptual model which can explain most of these differences. The model is based on several assumptions. The background and relevance for using these assumptions are discussed and estimated depths to the interface between non-saline and saline groundwater, based on the conceptual model, are presented. (au).

1660 (SKB-TR–92-05) **Buoyancy flow in fractured rock with a salt gradient in the groundwater - An initial study.** Claesson, J. (Lund Univ., Dept. of Building Physics (Sweden)). Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Feb 1992. 76p. Order Number DE93603615. Source: OSTI; NTIS; INIS.

Nuclear waste, deposited in canisters in rock, produces heat that will induce a buoyancy flow of groundwater in fractures. The radioactive material may then, in case of leakage, possibly reach the biosphere. The groundwater density will increase downwards with an increasing salt content. This density increase counteracts the thermal buoyancy, and it may create a natural barrier for the repository. The aim of the study is to analyse this barrier effect and to assess the extent of upward flow. The coupled flow process for groundwater, salt and heat is studied. The equations have been analysed in great detail, and a numerical model has been developed for the case of groundwater flow in a fracture or crack plane.

The largest upward motion from the repository has been determined with the model for a wide range of heat release. Approximate formulas, which are shown to be sufficiently accurate for assessments, have been derived. There is a very clear barrier effect. In a reference case with a salt concentration increase of 2% per km downwards, and with as much as 300 canisters (releasing all in all 0.32 TWh) placed in a limited region, the largest upward movement of groundwater from the repository region became 150 m. The results is remarkably insensitive to variations of the involved parameters (heat release, distance from canisters to fracture plane, considered time, salt concentration gradient, thermal expansivity, hydraulic conductivity of flow plane and so on). (au).

1661 (SKB-TR--92-10) **Description of groundwater chemical data in the SKB database GEOTAB prior to 1990.** Laurent, S. (IVL, Stockholm (Sweden)); Magnusson, S.; Nilsson, A.C. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Apr 1992. 52p. Order Number DE93603616. Source: OSTI; NTIS; INIS.

Groundwater chemical investigations are one of the research areas in SKBs research and development program for the final disposal of spent nuclear fuel. Since 1985 a specially designed integrated system consisting of a mobile field laboratory and a down-hole measuring probe is used for the chemical characterization of deep groundwater. The groundwater chemical analyses are performed in the field laboratory and E_h and pH are measured in situ by the down-hole probe. The chemical data obtained from the specific site investigations are stored in the GEOTAB database on the VAX computer at SKB. The description of chemical data handling given in this paper concerns the period after 1985. (au).

1662 (WSRC-RP--91-1213) **Biological monitoring of Upper Three Runs Creek, Savannah River Site, Aiken County, South Carolina, March 1990--July 1991.** Westinghouse Savannah River Co., Aiken, SC (United States); Chem-Nuclear Lab. Services, Inc., Greenville, SC (United States). Dec 1991. 197p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93000638. Source: OSTI; NTIS; GPO Dep.

In anticipation of the fall 1988 start up of effluent discharges into Upper Three Runs Creek by the F/H Area Effluent Treatment Facility of the Savannah River Site, Aiken, SC, a two and one half year biological study was initiated in June 1987. Upper Three Runs Creek is an intensively studied fourth order stream known for its high species richness. Designed to assess the potential impact of F/H area effluent on the creek, the study included qualitative and quantitative macroinvertebrate stream surveys at five sites (see map), chronic toxicity testing of the effluent, water chemistry and bioaccumulation analysis. In a March 1990 study of the potential impact of F/H Area effluent on the macroinvertebrate communities of Upper Three Runs Creek was extended, with reductions in the number of sites to be sampled and in the frequency of water chemistry sampling. This report presents the results of macroinvertebrate stream surveys at three sites, chronic toxicity testing of the effluent and water chemistry analysis of the three stream sites and the effluent from March 1990 to July 1991.

55 BIOMEDICAL SCIENCES, BASIC STUDIES

1663 (LBL-PUB--701) **Mathematics and biology: The interface, challenges and opportunities.** Levin, S.A. (ed.) (Cornell Univ., Ithaca, NY (United States)). Lawrence Berkeley Lab., CA (United States). Jun 1992. 96p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant DMS-89-10353. (CONF-9004365--Summ.: National Science Foundation (NSF) workshop on mathematics and biology, Washington, DC (United States), 28 Apr - 3 may 1990). Order Number DE92041207. Source: OSTI; NTIS; INIS; GPO Dep.

The interface between mathematics and biology has long been a rich area of research, with mutual benefit to each supporting discipline. Traditional areas of investigation, such as population genetics, ecology, neurobiology, and 3-D reconstructions, have flourished, despite a rather meager environment for the funding of such work. In the past twenty years, the kind and scope of such interactions between mathematicians and biologists have changed dramatically, reaching out to encompass areas of both biology and mathematics that previously had not benefited. At the same time, with the closer integration of theory and experiment, and the increased reliance on high-speed computation, the costs of such research grew, though not the opportunities for funding. The perception became reinforced, both within the research community and at funding agencies, that although these interactions were expanding, they were not doing so at the rate necessary to meet the opportunities and needs. A workshop was held in Washington, DC, between April 28 and May 3, 1990 which drew together a broadly based group of researchers to synthesize conclusions from a group of working papers and extended discussions. The result is the report presented here, which we hope will provide a guide and stimulus to research in mathematical and computational biology for at least the next decade. The report identifies a number of grand challenges, representing a broad consensus among the participants.

1664 (BNL--47940) **Evaluating bacterial activity from cell-specific ribosomal RNA content measured with oligonucleotide probes.** Kemp, P.F.; Lee, S.; LaRoche, J. Brookhaven National Lab., Upton, NY (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93000370. Source: OSTI; NTIS; GPO Dep.

We describe a procedure for measuring the cell-specific quantity of ribosomal RNA (rRNA) and DNA in order to evaluate the frequency distribution of activity among cells. The procedure is inherently quantitative, does not require sample incubation and potentially can be taxon-specific. Fluorescently-labelled oligonucleotide probes are hybridized to the complementary 16S rRNA sequences in preserved, intact cells. The resulting cell fluorescence is proportional to cellular rRNA content and can be measured with a microscope-mounted photometer system, by image analysis, or by flow cytometry. Similarly, DNA content is measured as fluorescence of cells stained with the DNA specific fluorochrome DAPI. These are either prepared as separate samples for purposes of enumeration and DNA measurements, or are dual-labelled cells which are also hybridized with oligonucleotide probes.

1665 (DOE/ER/60673--T5) **Neutron scatter studies of chromatin structures related to functions: Technical progress report, November 1, 1991--May 15, 1992.** Bradbury, E.M. California Univ., Davis, CA (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-88ER60673. Order Number DE93002520. Source: OSTI; NTIS; INIS; GPO Dep.

Despite of setbacks in the lack of neutrons for the proposed We have made considerable progress in chromatin reconstitution with the VLR histone H1/H5 and in understanding the dynamics of nucleosomes. A ferromagnetic fluid was developed to align biological molecules for structural studies using small-angle-neutron-scattering. We have also identified and characterized an intrinsically bent DNA region flanking the RNA polymerase I binding site of the ribosomal RNA gene in Physarum Polycephalum. Finally projects in progress are in the areas of studying the interatctions of histone H4 amino-terminus peptide 1-23 and acetylated 1-23 peptide with DNA using thermal denaturation; study of GGAAT repeats found in human centromeres using high resolution Nuclear magnetic Resonance and nuclease sentivity assay; and the role of histones and other sperm specific proteins with sperm chromatin.

1666 (DOE/ER/60700--5) **Advanced sequenching technology: Second year progress report.** Gesteland, R.F. Utah Univ.,

Salt Lake City, UT (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER60700. Order Number DE93001387. Source: OSTI; NTIS; GPO Dep.

This progress report briefly describes the laboratory's advances in chemiluminescent detectors for sequencing DNA, sequence reading algorithm, and for automation of sequencing.(DT)

1667 (EUR–12832) **Biotechnology an Overview of Applications and Impact on Environment.** Lecqq, A.F. Commission of the European Communities, Luxembourg (Luxembourg). 1990. 38p. Source: OSTI; NTIS (US Sales Only).

The state of art in the main areas of application of the biotechnologies i.e. pharmaceutical, chemical, agriculture and food industries as well as diagnosis, energy and environmental sectors is broadly reviewed. The present and possible future applications ongoing research and problems to be solved are considered. A greater importance is however given to the areas more closely related to the environment such as agriculture, energy production and pollution reduction. An overview of the possible risks and consequences to the environment and on man due to the use of these new technologies is also reported. Finally a suggestion for a possible contribution of the JRC in the field of biotechnology is proposed.

1668 (IS-T–1629) **Instrumental and theoretical development of capillary electrophoresis and its application to biological systems.** Lee, T.T. Ames Lab., IA (United States). 9 Sep 1992. 254p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE93001220. Source: OSTI; NTIS; GPO Dep.

Essential aspects of capillary electrophoresis (CE) are outlined. By integrating the electrophoretic current during electromigration, a migration index and an adjusted migration index are used to compare results obtained under changing conditions (constant and gradient fields, capillary lengths, inner diameters, ζ-potentials). Except for inner diameter cases, the indices are superior to all other indicators, and the qualitative precision of migration data is improved. Integration of the current during injection raises the quantitative precision of manual electrokinetic injection to the levels attained with hydrodynamic injection. A model based on field-amplified CE is proposed to describe the electrokinetic injection process involving samples with distinct conductivities and an equation is developed to allow normalization of peak areas at the 1–5 % level without the need for quantitative internal standardization. Experiments reveal that the model is valid when electromigration is the predominant mode of migration during injection. Design and performance of a rugged, compact, user-friendly and easily constructed laser-induced fluorescence (LIF) detector for CE are presented.

1669 (DOE/BP/12885–1) **Genetic analysis of Oncorhynchus nerka: Annual progress report.** Brannon, E.L. (Idaho Univ., Moscow, ID (United States)); Setter, A.L.; Welsh, T.L.; Rocklage, S.J.; Thorgaard, G.H.; Cummings, S.A. Idaho Univ., Moscow, ID (United States). Jan 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-90BP12885. Order Number DE92040084. Source: OSTI; NTIS; GPO Dep.

The 1990 project to develop DNA assessment techniques for the purpose of determining relationships among populations of Oncorhynchus nerka demonstrated differences that had potential for such application. The work was continued in 1991 with specific application of the techniques to develop DNA probes that could be used in separating populations of O. nerka associated with the lakes in the upper Salmon River, principally those in Redfish Lake. Research included sockeye-kokanee life history studies that might add supporting evidence for assessing the degree of difference or similarity among populations in the lake systems. This report summarizes the annual activities under the work plan.

1670 (DOE/ER/13967–T1) **[Genetics and biochemistry of surfactant synthesis in Rhodococcus sp. H13-A]: Final report.** North Carolina State Univ., Raleigh, NC (United States). Dept. of Microbiology. [1989]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER13967. Order Number DE93000913. Source: OSTI; NTIS; GPO Dep.

The rationale for these studies resides is that biosurfactant synthesis occurs only when cells are grown with alkanes as sole source of carbon and energy. It is reasoned that biosurfactant synthesis is linked genetically to alkane oxidation and that the identification and characterization of the alk genes would provide information about the structural and regulator genes involved, in biosurfactant synthesis. Rhodococcus H13-A chromosomal DNA was isolated and digested with the restriction endonuclease Sau3A. The shuttle vector, pMVS301, was single site cleaved with Bgl II, phosphorylated, and the chromosomal DNA fragments agated into linearized pMVS301. The ligation mixture was used to transform competent E. coli HB101. The chromosomal DNA fragment has been cloned into pMVS301 which appears to contain genes encoding the initial oxidation of alkane. Electrophoration of Rhodococaus indicates transformation by this technique. Further studies are required to optimize conditions.

1671 (DOE/ER/60636–4) **Genes and gene expression: Localization, damage and control – A multi-level and interdisciplinary study: Progress report, February 1, 1992–January 31, 1993.** Ts'o, P.O.P. Johns Hopkins Univ., Baltimore, MD (United States). Aug 1992. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER60636. Order Number DE92041136. Source: OSTI; NTIS; GPO Dep.

This progress report describes gains made in three projects entitled (1) 3-Dimensional nuclear topography of genes and chromosomes in interphase nuclei, (2) Sequence specific identification and perturbation of the genomic DNA in living cells by nonionic oligonucleotide analogs (Matagen), and Resolution and isolation of specific DNA restriction fragments.(DT)

1672 (DOE/ER/61162–1) **International workshop on chromosome 3: Final report, April 15, 1991–April 14, 1992.** Gemmill, R.M. Eleanor Roosevelt Inst., Denver, CO (United States). Jul 1992. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER61162. (CONF-9104396–Absts.: 2. international workshop on Human Chromosome 3, Denver, CO (United States), 4-5 Apr 1991). Order Number DE93002732. Source: OSTI; NTIS; GPO Dep.

The Second Workshop on Human Chromosome 3 was held on April 4–5, 1991 at Denver, Colorado. There were 43 participants representing 8 nations. The workshop participants reviewed the current state of the chromosome 3 map, both physical and genetic, and prepared lists of markers and cell lines to be made commonly available. These markers and cell lines should be incorporated into the mapping efforts of diverse groups to permit the integration of data and development of consensus maps at future workshops. Region specific efforts were described for sections of the chromosome harboring genes thought to be involved in certain diseases including Von Hippel-Lindau disease, 3p- syndrome, lung cancer and renal cancer.

1673 (DOE/ER/61230–1) **[Development of a Human Genome Data Base]: Progress report.** Johns Hopkins Univ., Baltimore, MD (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC02-91ER61230. Order Number DE92040626. Source: OSTI; NTIS; GPO Dep.

This report describes managerial aspects and briefly some technical accomplishments a Human Genome Database in Baltimore.

1674 (DOE/ER/61232–2) **[Multiplex mapping of human cDNAs]: Technical progress report.** Nierman, W.C. American Type Culture Collection, Rockville, MD (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER61232. Order Number DE93003066. Source: OSTI; NTIS; GPO Dep.

We have tested and implemented several protocols to increase productivity for mapping expressed sequence tags EST sequences to human chromosomes. These protocols include adopting PRIMER which permits utilization of batch files, as the standard software for PCR primer design; adding a human 21-only cell line to the NIGMS panel No. 1 to improve discrimination in discordancy

analyses involving chromosome 21, adding a monochromosomal hybrid panel to facilitate chromosome assignment of sequences that are amplified from more than 1 chromosome; combining the products of multiple PCR reactions for electrophoretic analysis (pseudoplexing); routinely multiplexing PCR reactions; and automating data entry and analysis as much as possible. We have applied these protocols to assign an overall total of 132 human brain CDNA sequences to individual human chromosomes. PCR primers were designed from ESTS and tested for specific amplification from human genomic DNA. DNA was then amplified using DNA from somatic cell hybrid mapping panels as templates. The amplification products were identified using an automated fluorescence detection system. Chromosomal assignments were made by discordancy analysis. The localized cDNAs include 2 for known human genes, 2 that map to 2 different human chromosomes, and 25 for cDNAs matching existing database records.

1675 (ORNL/RE–25-No.1) **Oak Ridge National Laboratory Review: Volume 25, No. 1, 1992.** Krause, C.; Pearce, J.; Zucker, A. (eds.). Oak Ridge National Lab., TN (United States). 1992. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93000457. Source: OSTI; NTIS; GPO Dep.

This report presents brief descriptions of the following programs at Oak Ridge National Laboratory: The effects of pollution and climate change on forests; automation to improve the safety and efficiency of rearming battle tanks; new technologies for DNA sequencing; ORNL probes the human genome; ORNL as a supercomputer research center; paving the way to superconcrete made with polystyrene; a new look at supercritical water used in waste treatment; and small mammals as environmental monitors.

1676 (BNL–47916) **Medical applications of synchrotron radiation at the National Synchrotron Light Source.** Thomlinson, W. Brookhaven National Lab., Upton, NY (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920821–1: 4. international conference on biophysics and synchrotron radiation, Tsukuba (Japan), 30 Aug - 5 sep 1992). Order Number DE93000374. Source: OSTI; NTIS; INIS; GPO Dep.

The overriding features of the synchrotron beams which make them applicable to medical research are their extremely high intensity and broadband energy spectrum. Several orders of magnitude separate the smooth, continuous spectrum of the synchrotron from the sharply peaked characteristic emission spectrum of a conventional source. Basically, the high intensity and tunability allow monochromatic beams to be generated at virtually any energy. The standard problem of beam hardening in both medical imaging and therapy is eliminated by the monochromatic beams since the energy spectrum does not change with passage through tissue. The tunable spectrum allows enhancement of images and therapeutic dose by selection of the most effective energy for a given procedure.

1677 (CONF-910529–, pp. 95-112) **Radiation absorbed dose and tumor response during therapy with iodine-131 conjugated 3F8 monoclonal antibody.** Cheung, N.K.V. (Memorial Sloan-Kettering Cancer Center, New York, NY (United States)); Pentlow, K.; Graham, M.C.; Yeh, S.J.; Finn, R.D.; Larson, S.M. American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., Atlanta, GA (United States). May 1992. DOE Contract FG02-86ER60407. From 5. international radiopharmaceutical dosimetry symposium; Oak Ridge, TN (United States); 7-10 May 1991. In *Fifth international radiopharmaceutical dosimetry symposium.* 625p. Order Number DE92013066. Source: OSTI; NTIS; INIS.

Optimal radioimmunotherapy (RIT) using murine antibody 3F8 against ganglioside G_{D2} in human neuroblastoma (NB) requires accurate measurement of radiation dose to tumor and normal organs. After intravenous (iv) injection of ^{131}-3F8 into nude mice xenografted with NB, serial planar gamma imaging and direct tumor size measurement provided tumor radioactivity uptake estimates (μCi/g) over time. Since the density of G_{D2} antigen in NB was high (5×10^6 molecules per cell), a large amount of antibody was needed to saturate all binding sites. A clear dose response was observed between 6.25 to 50 mCi/kg body wt of ^{131}I-3F8. The higher the administered activity, the more rapid and significant the shrinkage. The radiation absorbed dose for each individual tumor was calculated. Tumors that received > 4,200 rads were completely eradicated. The duration of tumor response was related to the radiation dose. The anti-tumor effect of 6-50 mCi/kg of iv ^{131}, I-3F8 was superior to single-fraction external beam radiation (250-1750 rads). The estimated tumor radiation dose was 150-200 rads/mCi/kg, while blood dose was 30-60 rads/mCi/kg. In patient studies, the calculated tumor radiation dose based on planar imaging, positron emission tomography(PET), as well as tissue biopsy was similar to the values estimated by animal experiments. The lack of organ toxicity (other than marrow and thyroid) was reproduced in clinical trials. The authors conclude that for 3F8 and NB, the athymic rodent xenograft model has provided a reasonable estimate of the radiation dose, in vivo tumor dose response, as well as the toxicity encountered during RIT.

1678 (DOE/ER/60434–7) **Boron in nuclear medicine: New synthetic approaches to PET and SPECT: Progress report, March 1, 1992–February 28, 1993.** Kabalka, G.W. Tennessee Univ., Knoxville, TN (United States). Dept. of Chemistry. Sep 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER60434. Order Number DE92040603. This annual progress report describes new methods of incorporation of radioiodine into physiologically active compounds (amphetamines), and the use of organoboranes to labeled radiopharmaceuticals with Oxygen- 15, Nitrogen-13, carbon-11 and fluorine-18. Preclinical studies are also reported on evaluation of butyothiophenones as agents acting at dopaminergic or serotonic synapses.

1679 (DOE/ER/60561–7) **New techniques for positron emission tomography in the study of human neurological disorders: Progress report, 15 June 1992–31 October 1992.** Michigan Univ., Ann Arbor, MI (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER60561. Order Number DE93002098. Source: OSTI; NTIS; INIS; GPO Dep.

During the past six months, we have continued work on the fronts of kinetic modeling of radioligands for studying neurotransmitter/receptor systems, iterative reconstruction techniques, and methodology for PET cerebral blood flow activation studies. Initial human PET studies have been performed and analyzed with many different kinetic model formulations to determine the quantitative potential of the neuronwsmitter/receptor ligand, [^{11}C]N-methyl piperidyl benzilate (NMPB), a muscarinic cholinergic antagonist. In addition, initial human studies using [^{11}C]tetrabenazine (TBZ), a marker for monoantine nerve terminal density. Results of the NWB studies have indicated that this new agent yields better estimates of receptor density than previous muscarinic ligands developed at our facility, [^{11}C]-TRB and [^{11}C]scopolamine. TRB and scopolamine have previously been shown to be only partially successful ligands due to sub-optimal values of the individual rate constants, causing varying degrees of flow limitation. This is found to be much less of a problem for NMPB due to the 2.0–2.5 fold increase in ligand transport observed in the human studies (~60% first pass extraction). A 2-parameter 2-compartment simplification had previously been implemented for the benzodiazepine ligand, [C-11]FMZ, and a similar model appears to be suitable for TBZ based on the preliminary human data.

1680 (DOE/ER/61104–T1) **Institute of Medicine letter report: Committee to review the Idaho National Engineering Laboratory proposal to convert its Power Burst Facility for use**

in boron neutron capture therapy. National Academy of Sciences, Washington, DC (United States). 1990. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER61104. Order Number DE92040996. Source: OSTI; NTIS; INIS; GPO Dep.

This report is the result of a request by the Secretary of Energy to the Institute of Medicine to convene an expert committee to evaluate the Idaho National Engineering Laboratory proposal to convert its Power Burst Facility (PBF) for use in research and development for Boron Neutron Capture Therapy (BNCT). The Committee was asked to conduct the evaluation within the context of the overall state of progress of BNCT as a potential therapeutic tool. The background for this request and review are provided first and they are followed by the Committee conclusions.

Charged particles, such as protons and heavy ions, are increasingly used in cancer radiotherapy. With respect to the conventional treatment using photons or electrons, they offer the advantage of a better concentration of the dose deposition at a depth corresponding to the tumor location. Moreover, biological advantages of these highly ionizing particles have also been observed for the treatment of radioresistant tumors. Such treatments require high precision in the localization of the dose deposition which must coincide exactly with the tumor volume. The used of radioactive beams of β^+ emitters, at several hundreds of MeV/u, combined with positron emission tomography provide radiotherapeutists with a unique tool which may be used either for diagnostic purposes, prior to the actual treatment (performed with a stable beam of higher intensity), or for on line controlled treatment if the necessary intensities ($\simeq 10^8$ pps) become accessible in the future.

1707 (LIU-TEK-LIC–91-48) **Laser doppler perfusion imaging.** Waardell, K. Linkoeping Univ. (Sweden). Dept. of Biomedical Engineering. 1992. 107p. Order Number DE93603729. Source: OSTI; NTIS; INIS.

Recording of tissue perfusion is important in assessing the influence of peripheral vascular diseases on the microcirculation. This thesis reports on a laser doppler perfusion imager based on dynamic light scattering in tissue. When a low power He-Ne laser beam sequentally scans the tissue, moving blood cells generate doppler components in the back-scattered light. A fraction of this light is detected by a photodetector and converted into an electrical signal. In the processor, a signal proportional to the tissue perfusion at each measurement site is calculated and stored. When the scanning procedure is completed, a color-coded perfusion image is presented on a monitor. To convert important aspects of the perfusion image into more quantitative parameters, data analysis functions are implemented in the software. A theory describing the dependence of the distance between individual measurement points and detector on the system amplification factor is proposed and correction algorithms are presented. The performance of the laser doppler perfusion imager was evaluated using a flow simulator. A linear relationship between processor output signal and flow through the simulator was demonstrated for blood cell concentrations below 0.2%. The median sampling depth of the laser beam was simulated by a Monte Carlo technique and estimated to 235 μm. The perfusion imager has been used in the clinic to study perfusion changes in port wine stains treated with argon laser and to investigate the intensity and extension of the cutaneous axon reflex response after electrical nerve stimulation. The fact that perfusion can be visualized without touching the tissue implies elimination of sterilization problems, thus simplifying clinical investigations of perfusion in association with diagnosis and treatment of peripheral vascular diseases. 22 refs.

1708 (STUK-A–98) **Intercomparison of radiotherapy treatment planning systems using calculated and measured dose distributions for external photon and electron beams.** Kosunen, A.; Jaervinen, H.; Vatnitskij, S.; Ermakov, I.; Chervjakov, A.; Kulmala, J.; Pitkaenen, M.; Vaeyrynen, T.; Vaeaenaenen, A. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). Feb 1991. 48p. Order Number DE93603758. Source: OSTI; NTIS; INIS.

The requirement of 5 % overall accuracy for the target absorbed dose in radiotherapy implies that the accuracy of the relative dose calculation should be within only a few per cent. According to the recommendation by the International Commission on radiation units and measurements (ICRU), a computer-produced dose distribution can be considered to be accurate enough if it differs from the results of relative dose measurements by less than 2 %, or 2 mm in

the position of isodose curves involving very steep dose gradients. In this study five treatment planning systems, currently used by the hospitals in Finland or in the USSR, were intercompared with respect to the above requirement. Five typical cases of irradiation were selected: regular fields, oblique incidence, irregular field, wedge field and inhomogeneity in a water equivalent phantom. Complete dose distributions were used for the intercomparison, and the beam data for each TPS was that pertaining to the beam where the comparative relative measurements were performed. The results indicate that the dose distributions produced by different TPS:s can differ from each other as well as from the measured dose distributions up to a level which is not acceptable in terms of the above requirement. Greatest differences seem to be related to the omission or undue consideration of the scatter components of the beam. A suitable quality assurance program for the systematic testing of the performance of the treatment planning systems could be based on a selection of tests as used in this study.(orig.).

1709 (AECL–10343) **Dose rate effect in food irradiation: A review.** Singh, H. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Aug 1991. 76p. Order Number DE93603672. Source: OSTI; NTIS (US Sales Only); INIS.

It has been suggested that the minor losses of nutrients associated with radiation processing may be further reduced by irradiating foods at the high dose rates generally associated with electron beams from accelerators, rather than at the low dose rates typical of gamma irradiation (e.g. ^{60}Co). This review briefly examines available comparative data on gamma and electron irradiation of foods to evaluate these suggestions. (137 refs., 27 tabs., 11 figs.).

1710 (CRN-PN–91-13) **Ionization of bovine meat products. Microbiological, nutritional and organoleptic consequences.** Desmonts, M.H. Strasbourg-1 Univ., 67 (France); Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. 28 Feb 1991. 227p. (In French). Order Number DE93720937. Source: OSTI; NTIS (US Sales Only); INIS.

In this thesis, the author analyses simultaneously the characteristics of sliced beef steaks, of minced beef steaks from industrial making and of beef and calf ionized liver rounds: microbiological quality, nutritional quality, and organoleptic quality. These analyses are systematically effected during 3 to 4 weeks on vacuum packaged products and stored at 3-4 deg C. The influence of ionization on microbiological, nutritional and organoleptic qualities is studied. These products are vacuum packaged in oxygen-porous films, ionized under accelerated electron with radiation doses from 1 to 5 kGy and stored at 3-4 deg C during 3-4 weeks. Then, other parameters are studied : fats rate of minced steaks (5 and 10%), packing quality (oxygen-tight packing and oxygen-porous film) and finally, the radiation dose rate (X or gamma-radiation and accelerated electrons). In conclusion, the ionization allows to improve the preservation time of vacuum packaged beef and calf liver rounds. Meat can be preserved during 10-14 days after having received a radiation dose of 3-4 kGy, without nutritional quality alteration.

1711 (DOE/AL/24327–T1, pp. 5-15) **Introduction to an irradiation project.** Vail, P.V.; Baritelle, J.L.; Rhodes, A.A. Agricultural Research Service, Washington, DC (United States); Economic Research Service, Washington, DC (United States). 1 Jun 1986. In *Irradiation disinfestation of dried fruits and nuts. Final report.* 263p. Order Number DE92018561. Source: OSTI; NTIS.

This paper describes the completion of a cooperative research project for the use of irradiation as a disinfestation procedure for dried fruits and nuts. The insects investigated were the codling moth (Cydia pomonella), navel orangeworm (Ameylois transitella), Indianmeal moth (Plodia interpunctella), and one species of driedfruit beetle (Carpophilus hemipterus). Radiation doses of 0, 150, 300, 600, and 900 Gy and other doses, as required, were to be tested. Taste panel data were collected in order to evaluate the effect of radiation on the products tests. Quality was examined immediately after irradiation and again after accelerated conditions equivalent to one year's storage. The specific areas of research and responsibilities for the US DOE, USDA, CH2M HILL, the dried fruit and nut industry groups, Oregon State University, and the University of California, Riverside, are described.

Food irradiation is an emerging technology that utilizes ionizing radiation to help reduce food losses after harvest. The author reviews the process and discusses issues of commercialization, safety, and product response. The advantages and disadvantages which must be weighed in choosing a radiation source for a given application are then explored. Sources include cobalt 60, cesium 137, electron beams, and X-rays.

1713 (DOE/AL/24327–T1, pp. 45-67) **Irradiator design and selection.** Sloan, D. (CH2M Hill, Albuquerque, NM (United States)). Final report.* 263p. Order Number DE92018561. Source: OSTI; NTIS.

Although detailed design can be somewhat complicated, a food irradiation system is very simple in concept. The principal components for an isotopic irradiators or a facility with a machine-generated radiation source include: (1) the radiation source; (2) a conveyor system to bring the product into the ionizing radiation chamber and back out again; (3) radiation shielding; (4) system controls to operate and manage a safe process. The radiation sources have already been briefly discussed in a previous section. The other irradiator components are addressed in this paper.

1714 (DOE/AL/24327–T1, pp. 69-111) **Efficacy of gamma radiation treatments for insect disinfestation of selected dried fruits and nuts.** Johnson, J.A. (Dept. of Agriculture, Fresno, CA (United States)); Vail, P.V. Agricultural Research Service, Washington, DC (United States); Economic Research Service, Washington, DC (United States). 1 Jun 1986. In *Irradiation disinfestation of dried fruits and nuts. Final report.* 263p. Order Number DE92018561. Source: OSTI; NTIS.

The primary research objective was to develop efficacy data on radiation treatments against Indianmeal moth, Plodia interpunctella (Huebner), navel orangeworm, Amyelois transitella (Walker) and driedfruit beetle, Carpophilus hemipterus (L.). Earlier work done on these and other species indicated that control could be obtained by treatment at doses not exceeding the FDA limit of 1 kGy (100 krad). while considerable information exists on the radiation doses required to prevent reproduction in numerous insect species, data on larval mortality and feeding behavior after irradiation are limited. In particular, the effectiveness of radiation in reducing commodity damage from feeding larvae is poorly understood. The authors research was therefore directed at determining the dose required to prevent reproduction and minimize feeding damage. As was expected, all stages of the DFB proved to be relatively radiosensitive, with 300 Gy preventing reproduction of pupae and adults and development of larvae. Complete mortality of irradiated adults and pupae occurred within one week after treatment. While exact measurements of larval longevity after treatment were not made, visual examination of treated raisins yielded no noticeable living larvae by two weeks after irradiation, with the youngest larvae dying even sooner. Thus, for the DFB, radiation as a control method does not have the same disadvantages found with lepdopterous larvae. The study indicates that gamma radiation treatments off 300 Gy would

provide control comparable to that obtained with methyl bromide treatments.

1715 (DOE/AL/24327–T1, pp. 113-134) **Efficacy of gamma radiation treatments for disinfestation of walnuts infested by codling moth larvae.** Burditt, A.K. Jr. (Dept. of Agriculture, Yakima, WA (United States)). Agricultural Research Service, Washington, DC (United States); Economic Research Service, Washington, DC (United States). 1 Jun 1986. In *Irradiation disinfestation of dried fruits and nuts. Final report.* 263p. Order Number DE92018561. Source: OSTI; NTIS.

The effect of gamma radiation for the disinfestation of walnuts infested by codling moth (Cydia pomonella) larvae was determined by treatment of nuts containing mature, cocooned larvae. In order to estimate the dosage required to prevent emergence of adults from mature larvae, a total of 26 trays, each containing about 380 infested apples, were held under conditions for production of larvae. Mature larvae left the apples and entered the nuts in search of a suitable site in which to spin their cocoons. Infested nuts were exposed to 42.3 or 84.6 Gy gamma radiation supplied by an AECL gammabeam-650 irradiator. Results show that irradiation significantly reduced emergence of normal adults. The dose required for quarantine security (99.9968% mortality) was 188 Gy based on emergence of any adults from treated larvae.

1716 (DOE/AL/24327–T1, pp. 135-167) **Quality evaluation of irradiated dried fruits and tree nuts.** Fuller, G. (Dept. of Agriculture, Albany, CA (United States)). Agricultural Research Service, Washington, DC (United States); Economic Research Service, Washington, DC (United States). 1 Jun 1986. In *Irradiation disinfestation of dried fruits and nuts. Final report.* 263p. Order Number DE92018561. Source: OSTI; NTIS.

Irradiation of agricultural commodities offers an alternative to fumigation as a means of insect disinfestation. The attractiveness of irradiation depends on a number of factors: economics, availability of chemical fumigants, and whether or not consumers accept the irradiated product. Samples of dried fruits and nuts were given doses of 150, 300, 600, and 900 Gy using cesium-137 as the source of gamma radiation. Results show that irradiation up to 900 Gy did not cause immediate deterioration in organoleptic quality of any of the commodities tested. With storage time, differences were more frequent or more noticeable at the higher irradiation levels. It was recommended that irradiation of the commodities, especially walnuts, be done at less than 600 Gy, preferably at 300-450 Gy. Multiple doses appear to be acceptable as long as the total dose does not exceed the limit. However, current regulations allow only a single irradiation. Since the study used accelerated storage, it was suggested that storage tests at ambient temperature should be evaluated. These could include additional factors such as possible protection by use of antioxidants.

1717 (DOE/AL/24327–T1, pp. 169-229) **Economic engineering feasibility of irradiation as a postharvest disinfestation treatment for California dried fruits and nuts.** Rhodes, A.A. (Univ. of California, Riverside (United States)); Baritelle, J.L. Agricultural Research Service, Washington, DC (United States); Economic Research Service, Washington, DC (United States). 1 Jun 1986. In *Irradiation disinfestation of dried fruits and nuts. Final report.* 263p. Order Number DE92018561. Source: OSTI; NTIS.

The purpose of this study is to evaluate the economic engineering feasibility of irradiation as a disinfestation treatment for California dried fruits and nuts. The study focuses on the four largest dried fruit and nut crops: almonds, walnuts, raisins and prunes, for which irradiation is most likely to be economical. The study compares irradiation with current practice, i.e. fumigation and other chemical controls, as well as with other alternatives to current practice: modified atmospheres and refrigeration. Possible insect control programs to replace all chemical treatments using either modified atmospheres and refrigeration alone, or some combination of modified atmospheres, refrigeration and irradiation are described, and the costs of these insect control programs are estimated. In the event that replacements for chemical controls must be found, new insect control concepts may be developed which may be superior to all those considered here. Nevertheless, the results of this study identify which, if any, dried fruit and nut disinfestation needs might possibly best be served by irradiation, at least in the event that chemical controls are not available. At the same time, estimated costs of alternative insect control programs are provided, which place an upper bound on the cost of replacing some of all chemical controls by alternative treatments.

1718 (IC–92/170) **Spontaneous regulating mechanisms that may have led to the origin of life.** Chela Flores, J. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 13p. Order Number DE93603677. Source: OSTI; NTIS (US Sales Only); INIS.

According to Salam condensation may be relevant in biochemistry, as a factor contributing to the homochirality of amino acids. We attempt to show that DNA packaging may be modelled, by interpreting chromatin as a form of soft matter, in which a phase transition has induced chromatin into a condensed mode. In the context of the origin of life we show the relevance of simultaneous discussion of DNA packaging, transcription, and DNA replication. Beyond a certain critical length of the protogenome (RNA), physical properties of inert condensed matter may have given rise to a spontaneous regulating mechanism of certain significance for the evolution of life on Earth. Gamma irradiation was applied to the biological quality improvement and preservation of white ginseng which has problems in a hygienic quality and storage stability. The current phosphine treatment showed no influence on microorganisms contaminated even though it was very useful for disinfestation of the sample, while 5 kGy irradiation effectively controlled the biological quality of the stored sample, with minimal effects on the quality parameters of white ginseng. Thus, it is concluded that gamma irradiation at a range of 5 kGy can be an alternative method of chemical fumigants provided air-tight packaging excluding recontamination is used for the stored product. (Author).

The total number of malignant neoplasms included on this study 7,787 cases(10.4%) among 74,928 cases for 2 years. On sex, females with 57.6% were much more than males with 42.4%. The highest proportion of cancer 50-59 age group. The most frequent primary site among males was found to be stomach with 36.2%, followed by liver(12.3%), lung(12.2%), esophagus(15.5%) and larynx(4.9%). In females, the first order was uterine cervix with 47.3%, followed most common type of morphology of malignant neoplasms was adenocarcinoma(39.0%) in males an squamous cell carcinoma(56.2%) in females. Among the cancer patients initially

diagnosed in this hospital, the proportion of malignant neoplasms by the extent of disease was 4.6% for patient with carcinoma-in-situ, 76.3% for patients with localized involvement, 11.6% for patients with regional involvement and 7.5% for patients with distant involvement. Among,the cancer patients initially treatment in this hospital, the proportion of malignant neoplasms by the method of treatment was 19.0% for surgery, 27.7 for radiotherapy and 24.2% for chemotherapy. Among the cancer patients confirmed by medical records, 11.2% was traced more than 5 years. (Author).

1722 (KAERI/RR–1097/91) **The application of irradiation techniques to food and foodstuffs.** Kwon, Joong Ho (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Cho, Han Ok; Byun, Myung Woo; Kim, Suc Won; Yang, Jae Seong. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1992. 162p. (In Korean). Order Number DE93605572. Source: OSTI; NTIS (US Sales Only); INIS.

To establish concrete infrastructure required for food irradiation commercialization, the project was designed to investigate the efficiency of irradiation techniques, such as preserving boiled-dried anchovy and improving its safety, improving the physical quality of soybeans and microbial-immobilization with radiation-induced polymer. Dried anchovies could be kept in a sanitary quality for over one year at cooling conditions (<10 deg C) instead of freezing by using 5 KGy-irradiation and airtight packaging(NY/PE). Gamma irradiation below 10 KGy was significantly effective for improving the hydration and cooking properties of soybeans. Immobilized microorganisms showed an increased-catalytic activity, producing lactic acid 15 times higher than that of free culture. (Author).

1723 (KAERI/RR–1099/91) **Studies on the application of radiation for genetic transformation in higher plants.** Lee, Young Il (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Song, Hi Sup; Kim, Jae Sung; Shin, In Chul; Lee, Sang Jae; Lee, Ki Woon; Lim, Yong Taek. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1992. 99p. (In Korean). Order Number DE93605567. Source: OSTI; NTIS (US Sales Only); INIS.

Present research carried out to develop the radiation application on the mutation research of genetic engineering. Some variants selected in M1 generation derived from the plantlet by the nodal stem culture of three potato cultivars irradiated with gamma rays, and the optimum dosage for mutation induction was revealed the range of 30 - 50 Gy of gamma ray. In the rice anther culture of the plant irradiated with gamma rays at different developmental stage of microspore, the haploidy callus formation rates were much higher in gamma ray irradiated anthers than those of non-irradiated, and the occurrence of a typical pollen was significantly increased up to 47% in the anthers irradiated with 30 Gy of gamma ray compared with 11% of non-irradiated anthers at the stage of pollen mother cell. A lot of variants were selected in rice, soybean, perilla and red pepper irradiated with gamma rays for breeding of earliness, short culm, high yielding and disease resistant mutant. (Author).

1724 (PCCF-T–92-01) **Study of chemistry transformations of in vivo implanted coral by nuclear analysis methods.** Sauvage, T. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. Jan 1992. 141p. (In French). Order Number DE93721006. Source: OSTI; NTIS (US Sales Only); INIS.

Neutron activation analysis and use of radioactive tracers, completed by X-rays diffraction, allowed us to quantitatively study the transformations in a biomaterial (coral) implanted 'in vivo'. Before its implantation, the biomaterial is sterilized. Sterilization by thermal effect or irradiation does not induce any macroscopic modification of the crystal structure: the biomaterial preserves its biocompatible properties. Coral was implanted in ovine and procine thighbones. Biopsies were extracted after different implantation times (1 to 24 weeks). The analyzed samples for each biopsy are the intermediate part (initially the coral) and the cortical next to the implant. We have measured the concentrations of Ca, P, Sr and Mg by neutron activation, as a function of the time of implantation. The results show that the mineral composition of the intermediate part is greatly modified. The concentrations of Ca, P, Sr and Mg become comparable to those of a mature about 3 to 5 months after implantation, depending upon the experimentation. The X-rays diffraction analysis of the implant reveals a gradual substitution of the coral aragonite crystal structure by an apatitic structure. The radioactive marking of Ca and Sr, initially constituting coral, allowed to measure the transfers of elements in organism and to specify the mechanisms of its transformations. This study exhibits a Ca and Sr contribution from organism for the bone neoformation. After five months, the calcium of the implant is no longer the one from the biomaterial. These results, obtained by sensitive and selective nuclear methods, suggest a biomaterial resorption followed by a formation of apatite. 68 figs., 57 tabs.

1725 (VTT-TIED–1027) **Identification of irradiated spices with aid of scintillation counter.** Uusheimo, K. (Technical Research Centre of Finland, Espoo (Finland). Reactor Lab.). Technical Research Centre of Finland, Espoo (Finland). Aug 1989. 36p. (In Finnish). Order Number DE93605573. Source: OSTI; NTIS; INIS.

The aim off the work was to determine how one can identify gamma-irradiated spices with aid of a scintillation counter (LKB/Wallac 1219 RackBeta Spectral) by chemiluminescence measurements. Even though scintillation counters are more sensitive than real luminometers they have not been capable in identifying the irradiated spices after contact with photosensitizer like luminol, isoluminol and lucigenin presumably because the actual chemiluminescence reaction took place before the sample vial reached the measuring range. Whereas it was noticed that the identification of pure, dry allspice, black pepper, white peppar and cardemom was possible without any solutions when there were also present similar unirradiated spices. The identification was possible even after 23 weeks duration depending on the dose of the irradiation (10 kGy or 50 kGy) and the weight of the samples (1 g or 9 g). The duration of the investigation was 23 weeks.

1726 (AECL–8407) **Potential health hazard of nuclear fuel waste and uranium ore.** Mehta, K.; Sherman, G.R.; King, S.G. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Jun 1991. 47p. Order Number DE93603662. Source: OSTI; NTIS (US Sales Only); INIS.

The variation of the radioactivity of nuclear fuel waste (used fuel and fuel reprocessing waste) with time, and the potential health hazard (or inherent radiotoxicity) resulting from its ingestion are estimated for CANDU (Canada Deuterium Uranium) natural-uranium reactors. Four groups of radionuclides in the nuclear fuel waste are considered: actinides, fission products, activation products of zircaloy, and activation products of fuel impurities. Contributions from each of these groups to the radioactivity and to the potential health hazard are compared and discussed. The potential health hazard resulting from used fuel is then compared with that of uranium ore, mine tailings and refined uranium (fresh fuel) on the basis of equivalent amounts of uranium. The computer code HAZARD, specifically developed for these computations, is described.

1727 (AECL–10563) **Review of ICRP Publication 60.** Heinmiller, B.E. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Jan 1992. 27p. Order Number DE93603685. Source: OSTI; NTIS (US Sales Only); INIS.

The recommendations of the ICRP were last formulated in 1977. The ICRP has periodically reviewed the recommendations and issued supplementary reports on specific topics. Over the last several years, enough new information accumulated on health effects from exposure to ionizing radiation to change appreciably the assumed risk estimates from such exposure, and to prompt the ICRP to reassess its recommendations for radiological protection. The resulting recommendations were approved by the ICRP in 1990 November. This report examines the recommendations from three perspectives. The first section of the report presents background information on the development of the recommendations and the risk

estimates on which they are based. The main reasons for the increase in current risk estimates from previous estimates are given. The second section of the report outlines the basic ICRP recommendations that are relevant to occupational and public radiological protection, and offers interpretation where needed. The third section of the report examines implications of the recommendations for dosimetry. the ICRP is currently working on improvements to some metabolic and dosimetric models. Because it is difficult, in some instances, to decouple the implications of this modelling work and the implications of the new recommendations, both are examined in this third section. This report documents why radiological protection standards have changed recently, what the current standards are, and how they might affect radiation dosimetry. (4 tabs., 15 refs.).

1728 (BNWL-CC–250) **Use of total beta counts to estimate GI tract dose rates.** Hall, R.B. Pacific Northwest Lab., Richland, WA (United States). 25 Oct 1965. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001317. Source: OSTI; NTIS; GPO Dep.

It was the practice for several years to estimate the potential dose rate to the gastrointestinal from sanitary water sources by evaluating the results of radiochemical analysis of individual nuclides. The proposed method estimates the GI tract dose from Pasco and Richland domestic water from measurements of the total beta activity, and permits more frequent and more economical evaluation of a variable source of radiation exposure. Beginning with 1964 data, the GI tract dose rate for Richland and Pasco sanitary water has been obtained by multiplying the total beta count by a conversion factor derived from the historical relationship between the radiochemical analyses and the total beta counts. Either the accumulation of more data or changes in the relative abundance of the more significant nuclides in the water may result in changes in this factor.

1729 (CONF-910529–, pp. 151) **Radium-223: An alpha emitter for radioimmunotherapy.** Fisher, D.R. (Pacific Northwest Lab., Richland, WA (United States)); Hui, T.E.; Wester, D.W.; Wai, C.M. American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., Atlanta, GA (United States). May 1992. DOE Contract AC06-76RL01830 ;AM06-70RL02225. From 5. international radiopharmaceutical dosimetry symposium; Oak Ridge, TN (United States); 7-10 May 1991. In *Fifth international radiopharmaceutical dosimetry symposium.* 625p. Order Number DE92013066. Source: OSTI; NTIS; INIS.

Two concerns have previously been cited for discounting the radionuclide ^{223}Ra (physical half-life = 11.4 d) as a suitable alpha-emitter for radioimmunotherapy: the lack of any ligand for binding radium to its delivery protein, and a suggested dosimetric disadvantage due to the 36-min. half-life of its unbound, third decay product, ^{211}Pb. However, ^{223}Ra can indeed be tightly bound to a suitable ligand without dissolution of free Ra^{++} in body fluids. Moreover, the radiation dosimetry of a ^{223} Ra-labeled monoclonal antibody should be highly favorable for radioimmunotherapy, even with redistribution of ^{211}Pb. In addition, the 11.4-d half-life allows for immunoconjugate preparation, administration, and tumor localization by carrier antibodies before significant radiological decay takes place. The short-lived decay products of ^{223} Ra, contribute to the estimated tumor/normal tissue dose ratio, and together with ^{223} Ra, provide a cascade of 3-4 alpha particles per Ra atom that should be highly effective in tumor cell-killing while sparing normal tissues. Photons from 223 Ra (in the ^{99m}Tc energy window) provide a means for tumor imaging and dosimetry. Radium-223 may be produced economically and in sufficient amount for wide-scale application. A generator system for on-site elution of carrier-free ^{223} Ra has also been proposed.

1730 (CONF-910529–, pp. 544-556) **Localized beta dosimetry of ^{131}I in human thyroid.** Hui, T.E. (Pacific Northwest Lab., Richland, WA (United States)); Fisher, D.R.; Johnson, J.R. American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., Atlanta, GA (United States). May 1992. DOE Contract AC06-76RL01830 ;AM06-70RL02225. From 5. international radiopharmaceutical dosimetry symposium; Oak Ridge, TN (United States); 7-10 May 1991. In *Fifth international radiopharmaceutical dosimetry symposium.* 625p. Order Number DE92013066. Source: OSTI; NTIS; INIS.

Localized beta dose distribution in human thyroid from ^{131}I was simulated using a geometrical thyroid model. The model consisted of a hexagonal-close-packed lattice of spherical follicles having a mean follicular diameter of about 200 μm. The wall of each thyroid follicle consists of a single layer of cuboidal follicular cells having an approximate thickness of 15 μm. The localized dose was calculated using the Berger point kernel formula for absorbed dose distributions of beta particles in water. Four factors affecting the localized beta dose distribution were considered: (1) the activity level of ^{131}I within the colloid of follicles, compared to that in follicular cells and the interfollicular space; (2) the diameter of follicles; (3) the fraction of follicles that actively concentrates iodide during the time of exposure; and (4) the fraction of lobules of follicles that are active during the time of exposure. The spatial distribution of dose at the multicellular level was calculated for a thyroid having an average absorbed dose of 1 Gy. No significant difference was found in the localized dose when the ^{131}I activity level within follicles varied from 25 to 75 times the activity level within follicular cells and interfollicular spaces, or when the average follicular diameter varied from 170 to 230 μm. In these situations, the localized dose was found to range from 0.8 to 1.2 Gy, varying by only 20% of the mean. However, if only 20% of follicles were active at any time during the exposure, the localized dose was found to be highly non-uniform, ranging from 0.4 to 3.0 Cy, and varying by a factor of 2.5 to 3 from the average thyroid dose. Finally, if only 20% of lobules of follicles were active at any time during the exposure, the localized dose was found to be highly non-uniform.

1731 (CRN-PN–91-24) **Applied dosimetry to ionization techniques by electron beams.** Kuntz, F. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. Dec 1991. 131p. (In French). Order Number DE93721008. Source: OSTI; NTIS (US Sales Only); INIS.

After a general introduction about electron beam dosimetry, the second part is about the determination of treatment parameter for an electron ionization: are treated the problems of electron path determination, treatment depth of a product and finally, the radiation dose heterogeneities in all the volume of a treated product. The third part describes a process that greatly reduces radiation dose heterogeneity and then industrial interest is analyzed. The fourth part describes 2 applications of diffusion screen utilization. 66 figs.

1732 (DOE/EH/89150–1) **Committee on Radiation Epidemiological Research Programs: Progress report, April 1, 1991–March 31, 1992.** Mahlum, D.D. National Research Council, Washington, DC (United States). Board on Radiation Effects Research. Jun 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91EH89150. Order Number DE92040516. Source: OSTI; NTIS; GPO Dep.

The Committee on DoE Radiation Epidemiological Research Programs was originally established in response to the needs of the Office of Health and Envirorunental Research, Office of Energy Research in the Department of Energy (DoE). Following a reorganization of DoE health related programs in 1990, the committee now advises the Office of Epidemiology and Health Surveillance which is under the Assistant Secretary for Environment, Safety and Health. These administrative changes have not altered the committee concerns but have served to focus the committee's attention on helping DoE plan for an effective system of worker health surveillance as well as an epidemiologic research program.

1733 (DOE/ER/60742–5) **An immunochemical approach to the study of DNA damage and repair: Technical progress report, May 1, 1989–April 30, 1992.** Wallace, S.S. (Vermont Univ., Burlington, VT (United States). Dept. of Microbiology and Molecular Genetics); Erlanger, B.F. Vermont Univ., Burlington, VT (United States). Dept. of Microbiology and Molecular Genetics. May 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER60742. Order Number DE93003122. Source: OSTI; NTIS; INIS; GPO Dep.

The overall objective of this project has been to develop immunochemical methods to quantitate unique DNA base damages in order to facilitate studies on radiation-induced damage production and repair. Specifically, we have been using antibodies raised to damaged bases to quantitate unique lesions in model systems in order to evaluate their potential biological consequences. Our

approach has been to synthesize modified nucleotides or nucleosides, conjugate them to protein carriers, and use the conjugates as immunogens in rabbits or to prepare monoclonal antibodies. We have been studying damages that are stable radiolysis products found in X-irradiated DNA and thus of potential biological consequence. Our aim is to build an in vitro and in vivo data base on the interactions between model DNA lesions and such cellular enzymes as DNA polymerases and repair endonucleases. Initial studies have focused on pyrimidine ring saturation products (thymine glycol.and dihydrothymine), products resulting from ring fragmentation or base loss (urea, B-ureidoisobutyric acid, abasic sites), 7-hydro-8-oxopurines, and more recently, cytosine radiolysis products. These modified bases serve as useful models for examining the potential lethal and/or mutagenic (carcinogenic) effects of the products of DNA radiolysis.

1734 (DOE/ER/60912–T1) **Radiation-induced microncephaly in guinea pigs.** Wagner, L.K.; Johnston, D.A.; Felleman, D.J. Texas Univ., Houston, TX (United States). [1992]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-89ER60912. Order Number DE93002866. Source: OSTI; NTIS; GPO Dep.

The effect of x rays on brain weight of guinea pig pups at birth was studied for 21-day old embroys exposed in utero to doses of 75 and 100 mGy. When compared to controls and when corrected for body weight, gestation time, litter size, sex, and examiner differences the brains of irradiated pups weighed approximately 46 mg less than those of controls ($p<0.001$) for the 75-mGy group and about 55 mg less for the 100-mGy group. Brains of females weighed 51 mg less than those of males of the same body weight. Dam weight and caging conditions had no observed effect on brain weight.

1735 (DOE/ER/61136–2) **An improved method for producing radiation hybrids applied to human chromosome 19: Technical progress report.** Jackson, C.L.; Mark, H.F.L. Rhode Island Hospital, Providence, RI (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER61136. Order Number DE93003156. Source: OSTI; NTIS; GPO Dep.

Using radiation hybrids from a monochromosomal microcell hybrid containing human chromosome 19 as its only human component (PK87-19), we have initiated analysis of a panel of hybrids for markers in known locations on human chromosome 19. Also begun was a fluorescent in situ hybridization analysis of the hybrid cell lines using biotinylated total human DNA as a hybridization probe to metaphase chromosomes prepared from the hybrids cell lines. We are analyzing our panel of 94 hybrids for additional markers obtained from the literature, or the genome data base as well as to complete the analysis of any hybrids not yet scored for the markers iii the table. The hybrid panel has been tested for apolipoprotein C_2 for the radiation hybrids for D19SI77 (mfd 120), D19SI78 (mfd 139) and for HRC (histidine rich calcium binding protein). In addition we have also analyzed for the presence of slow troponin 1 (TNNT1) and GPI (glucose phosphate isomerase).

1736 (DOE/OR/00033–T486) **Effects of α-particle radiation on rat tracheal epithelial cells.** Ford, J.R. Jr. Oak Ridge Associated Universities, Inc., TN. (United States). Aug 1992. 173p. Sponsored by USDOE, Washington, DC (United States); Department of Health and Human Services, Washington, DC (United States). DOE Contract AC05-76OR00033 ;AC05-84OR21400. Grant 2R01 CA34695. Order Number DE92041036. Source: OSTI; NTIS; INIS; GPO Dep.

Thesis submitted to the Univ. of Tennessee, Knoxville.

By a combination of methods, which included flow cytometry and magnetic cell sorting, we have demonstrated that the cells of the rat tracheal epithelium which have the greatest proliferative capacity in culture and in vivo are the basal cells. Because of these findings it seems reasonable to suppose that the basal cells are the most likely target for the action of α-particle radiation in pseudostratified respiratory epithelium. This hypothesis is further supported by the finding that the basal cells are the cells which appear to respond to the tumor promoter 12-O-tetradecanoylphorbol-13-acetate. The effects of ^{210}Po α-particles on the survival and oncogenic transformation of rat tracheal epithelial cells in suspension were investigated. Since these effects were assayed in culture, the results pertain to the reaction of only the basal cells to irradiation. The results indicate that α-particles are extremely cytotoxic in that a track segment of 4 μm, on average, is sufficient to cause the reproductive death of basal cells. This finding is supported by similar results obtained with two cell lines, Mv1Lu and CHO-K1 BH_4. Production of proliferating epithelial foci by α-particles was not distinguishable from control and sham treatments. These results are in direct conflict with many of the results that have been obtained with C3H 1OT1/2 cells in similar transformation assays. Some possible reasons for these disparities are discussed and supporting evidence is provided.

1737 (DOE/RW–0362-SR) **Science, society, and America's nuclear waste: Unit 2, Ionizing radiation.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (United States). [1992]. 41p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge); INIS.

High-energy, ionizing radiation is called ionizing because it can knock electrons out of atoms and molecules, creating electrically charged particles called ions. Material that ionizing radiation passes through absorbs energy from the radiation mainly through this process of ionization. Ionizing radiation can be used for many beneficial purposes, but it also can cause serious, negative health effects. That is why it is one of the most thoroughly studied subjects in modern science. Most of our attention in this publication is focused on ionizing radiation – what it is, where it comes from, and some of its properties.

1738 (EHD-TR–152) **Environmental radioactivity in Canada 1988: Radiological monitoring annual report.** Department of National Health and Welfare, Ottawa, ON (Canada). Health Protection Branch. 1991. 46p. Order Number DE93603693. Source: OSTI; NTIS (US Sales Only); INIS.

The radiological surveillance program of the Department of National Health and Welfare is conducted for the purpose of determining levels of environmental radioactivity in Canada and assessing the resulting population exposures. Following major changes to the CAMECO Port Hope operations to reduce uranium emissions, a study was initiated to measure uranium levels in air in the community. Studies continued on lung cancer and domestic exposure to radon, and current levels of cesium-137 in caribou, a major source of food in northern communities. The movement of tritium on the Ottawa and St. Lawrence rivers was studied following an accidental release into the Ottawa River. Monitoring continued of fallout contamination from Chernobyl in imported foods. All measurements recorded during 1988 were below the limits recommended by the International Commission on Radiological Protection. (14 refs., 14 figs., 15 tabs.).

1739 (IGC–123) **Review of literature on bioassay methods for estimating radionuclides in urine.** Prasad, M.V.R.; Surya Narayana, D.S.; Jeevanram, R.K.; Sundarajan, A.R. Indira Gandhi Centre for Atomic Research, Kalpakkam (India). 1991. 55p. Order Number DE93605558. Source: OSTI; NTIS (US Sales Only); INIS.

Bioassay methods of certain important radionuclides encountered in the nuclear fuel cycle operations, viz., thorium, uranium, sup(239)Pu, sup(241)Am, sup(90)Sr, sup(99)Tc, sup(106)Ru, sup(137)Cs are reviewed, with special emphasis on urinalysis. Since the preconcentration is an important prerequisite for bioassay, various preconcentration methods are also discussed. Brief account of various instruments both nuclear and analytical used in the bioassay programme is included. The sensitivities of the methods cited in the literature vis-a-vis the derived recording levels indicated in ICRP recommendations are compared. Literature surveyed up to 1990 is tabulated. (author). 96 refs., 1 fig ., 3 tabs.

1740 (INFO–0300-2) **Childhood leukaemia around Canadian nuclear facilities. Phase 2: Final report.** Clarke, E.A. (Ontario Cancer Treatment and Research Foundation, Ottawa, ON (Canada)); McLaughlin, J.; Anderson, T.W. Atomic Energy Control Board, Ottawa, ON (Canada). Jun 1991. 94p. Order Number DE93603650. Source: OSTI; NTIS (US Sales Only); INIS.

Prompted by findings of increased occurrence of childhood leukaemia in the vicinity of some nuclear facilities in the United

Kingdom, this study aimed to investigate whether the frequency of leukaemia among children born to mothers living near nuclear facilities in Ontario differed from the provincial average. The Ontario Cancer Registry was used to identify 1894 children aged 0 to 14 years who died from leukaemia between 1950 and 1987, and 1814 children who were diagnosed with leukaemia between 1964 and 1986. Residence at birth and death was obtained from birth and death certificates. Analyses were performed separately for nuclear research and development facilities; uranium mining, milling and refining facilities; and, nuclear generating stations; and for areas within the same county as the facility and 'nearby' - within a 25-km radius of the facility. Risk estimates were calculated as the ratio of the observed (O) number of events over the expected (E) number. In the vicinity of nuclear research and development facilities the rate of leukaemia was less than expected and within the bound of chance variation. In the areas around the uranium mining, milling and refining facilities and nuclear power plants leukaemia occurred slightly more frequently than expected, but due to small frequencies these differences may have arisen due to chance. Large differences between observed and expected rates were not detected around any of the Ontario facilities. This study was large enough to detect excess risks of the magnitude reported in the United Kingdom, but it was not large enough to discriminate between the observed relative risks and a chance finding. Levels of leukaemia detected near nuclear generating stations indicate the need for further investigation. (20 tabs., 15 figs., 32 refs.).

1741 (INFO–0363) **Physical characteristics and solubility of long-lived airborne particulates in uranium producing and manufacturing facilities: A report upon completion of Phase I of the study.** Robertson, R. (Becquerel Laboratories Inc. (Canada)); Jones, S. Atomic Energy Control Board, Ottawa, ON (Canada). Oct 1988. 27p. Project 4.103.2. Order Number DE93603663. Source: OSTI; NTIS (US Sales Only); INIS.

The rates of dissolution in simulated lung fluid of uranium-238, thorium-230, radium-226, and lead-210 from a uranium ore matrix and of uranium-238 only from a uranium dioxide matrix have been studied. Changes in solubility rates accompanying changes in lung fluid pH and flow rate were examined. The effect of neutron irradiation of the solid matrices upon solubility was investigated. Using the carrier-free tracer isotopes, thorium-234, radium-224, and lead-203, the hold-back effects of coprecipitation and adsorption upon available surfaces within the dissolution cells were explored. It was found that a shift from pH 7 to 8 in the lung fluid phase reduces uranium-238 solubility by about 10%, thorium-230 by about 90%, and radium-226 by approximately 40%. There is no discernible effect upon lead-210. Within the range of the flow rates studied, it has been found that the solubility rates of all the elements of interest do not change significantly in moving from an approximately constant lung fluid flow rate to a flow rate decreasing with time. Results indicate that fast neutron irradiation of a uranium ore matrix reduces the solubility rate of uranium-238 by about 50%, of thorium-230 by 20-30% and of radium-226 by 20-30%. There was no discernible effect on lead-210. Similar irradiation of a uranium dioxide matrix appeared to have no effect on uranium-238 solubility. The integrated fast neutron flux was approximately 5×10^{14} neutrons per centimetre squared in both cases. The irradiation was by reactor neutrons under cadmium and represents the irradiation conditions typically used for the determination of uranium and thorium on aerosol filters by neutron activation analysis. Tracer studies showed that coprecipitation and adsorption effects play a prominent role in determining the rates of extraction of thorium and lead from the extraction cells used in this work. The effect for radium is small. (2 refs., 16 tabs., fig.).

1742 (INFO–0363-1) **Physical characteristics and solubility of long-lived airborne particulates in uranium producing and manufacturing facilities: A report upon completion of the extension to Phase I of the study.** Robertson, R. (Becquerel Laboratories Inc. (Canada)); Jones, S. Atomic Energy Control Board, Ottawa, ON (Canada). Aug 1989. 22p. Project 4.103.2. Order Number DE93603664. Source: OSTI; NTIS (US Sales Only); INIS.

The rate of dissolution in simulated lung fluid of uranium from three different ore matrices and from refined uranium dioxide has been studied in an essentially all teflon extraction apparatus. The rate of dissolution of thorium from a nickel metal/2% thoria mixture has been similarly studied. The effect of neutron irradiation of the studied materials upon the above dissolution rates has been investigated. The adsorption of the radioisotope tracers barium 133 (substitute for radium), lead 203 and thorium 234 upon the extraction system components has been examined. It has been found that the thoria component of the nickel/thoria material is essentially totally insoluble. No thorium was detected in any of the six lung fluid fractions collected and the total thorium removed from 50 mg samples under the experimental conditions was < 0.5% of the thorium present in the starting material. Neutron irradiation of the uranium ores and of uranium dioxide for two minutes under cadmium using an epicadmium neutron flux of about 5×10^{11} n cm^{-2} s^{-1} increases uranium solubility by 5% to 35% depending on the sample material. There was no observable effect on the nickel/thoria material. (3 refs., 7 tabs., fig.).

1743 (INFO–0377) **Toxicity and dosimetry of tritium: A review.** Myers, D.K.; Johnson, J.R. Atomic Energy Control Board, Ottawa, ON (Canada). Advisory Committee on Radiological Protection. Jan 1991. 112p. (In English, French). (ACRP–10;CCRP–10.). Order Number DE93605552. Source: OSTI; NTIS (US Sales Only); INIS.

Tritium doses to the general public are very low (currently about 0.2 μSv per year). Radiation doses from tritium to members of the public living in the vicinity of a CANDU power station are higher but rarely exceed 20 μSv per year or 1% of normal exposures to radiation from all natural sources, but doses to some radiation workers can approach ten mSv per year. The relative biological effectiveness (RBE) of tritium beta rays varies appreciably depending upon the biological endpoint. Observed RBE values at low doses and low dose-rates are usually about 2 to 3 when tritium beta rays are compared to ^{60}Co gamma rays but are closer to 1 than to 2 when compared to 200 kVp X-rays. This conclusion is supported by microdosimetric considerations of the quality of tritium beta rays, ^{60}Co gamma rays and X-rays. Since X-rays have traditionally been accepted as reference radiation by the International Commission on Radiological Protection, it seems reasonable that the quality factor (Q) assigned to tritium beta rays should be close to one. Recommended procedures in Canada for estimation of effective dose equivalents from exposures to HTO and HT assume that Q = 1 and that body water represents 67% of the mass of soft tissue; they take into account conversions of HTO to appear to be reasonable for radiation protection purposes when the source of exposure is HTO or HT, but will not be adequate for exposures to other tritiated compounds. (modified author abstract) (137 refs., 11 figs., 12 tabs.).

1744 (INFO–0389) **A review of radiation risk estimates.** Atomic Energy Control Board, Ottawa, ON (Canada). Advisory Committee on Radiological Protection. Jun 1991. 120p. (ACRP–13.). Order Number DE93603651. Source: OSTI; NTIS (US Sales Only); INIS.

Three authoritative reports (UNSCEAR-1988, BEIR-V-1990, and ICRP-1990 Recommendations) on risk estimates have been reviewed and compared to previous risk estimates published by the same organizations. The ICRP now uses the term 'probability' in place of the term 'risk'. For fatal cancers, the new ICRP probability estimates are 5.0×10^{-2} Sv^{-1} for a population of all ages and 4.0×10^{-2} Sv^{-1} for a population of working age. For serious hereditary effects summarized over all generations, the ICRP probability coefficients are 1.0×10^{-2} Sv^{-1} for a population of all ages and 0.6×10^{-2} Sv^{-1} for a population of working age. For prenatal irradiation, at 8 - 15 weeks after conception, there may be a decrease of 30 I.Q. points per Sv and a risk of cancer which may lie in the range of 2 to 10×10^{-2} Sv^{-1}. Based mainly on the new probability estimates the ICRP recommends a limit on effective dose of 20 mSv per year, averaged over 5 years (100 mSv in 5 years) with the further provision that the effective dose should not exceed 50 mSv in any single year. For public exposure the ICRP recommends an annual limit on effective dose of 1 mSv. However, in special circumstances, a higher value of effective dose could be allowed in a single year provided that the average over 5 five years does not exceed 1 mSv per year. Once pregnancy has been declared, the

conceptus should be protected by applying a supplementary equivalent dose limit to the surface of the woman's abdomen of 2 mSv for the remainder of the pregnancy and by limiting intakes of radionuclides to about 1/20 of the annual limit on intake. A brief survey of epidemiological studies of workers and the risks from radon and thoron progeny is also included. (110 refs, 29 tabs., 10 figs.).

1745 (INFO–0401) **Tritium releases from the Pickering Nuclear Generating Station and birth defects and infant mortality in nearby communities 1971-1988.** Johnson, K.C. (Department of National Health and Welfare, Ottawa, ON (Canada). Lab. Centre for Disease Control); Rouleau, J. Atomic Energy Control Board, Ottawa, ON (Canada). Oct 1991. 105p. Project 7.156.1. Order Number DE93603652. Source: OSTI; NTIS (US Sales Only); INIS.

This study was commissioned to examine whether there were elevated rates of stillbirth, birth defects, or death in the first year of life between 1971 and 1988 among offspring of residents of communities within a 25-kilometre radius of the Pickering Nuclear Generating Station. The study was also to investigate whether there were any statistical associations between the monthly airborne or waterborne tritium emissions from the Pickering Nuclear Generating Station and the rates of these reproductive outcomes. Overall analysis did not support a hypothesis of increased rates of stillbirths, neonatal mortality or infant mortality near the Pickering Nuclear Generating Station, or a hypothesis of increased birth prevalence of birth defects for 21 of 22 diagnostic categories. The prevalence of Down Syndrome was elevated in both Pickering and Ajax; however, there was no consistent pattern between tritium release levels and Down Syndrome prevalence, chance could not be ruled out for the associations between Down Syndrome and tritium releases or ground-monitored concentrations, the association was detected in an analysis where multiple testing was done which may turn up significant associations by change, and maternal residence at birth and early in pregnancy needs to be verified. The association between Down Syndrome and low-level radiation remains indeterminate when existing evidence from epidemiological studies is summed. The estimated radiation exposure from the nuclear plant for residents of Pickering and Ajax is lower by a factor of 100 than the normal natural background radiation. Further study is recommended. (21 tabs., 29 figs., 5 maps, 37 refs.).

1746 (INFO–0402) **Guidelines for the medical surveillance of atomic radiation workers.** Atomic Energy Control Board, Ottawa, ON (Canada). Group of Medical Advisers. Nov 1991. 20p. (In English, French). (GMA–1.). Order Number DE93605610. Source: OSTI; NTIS (US Sales Only); INIS.

These guidelines are provided for the use and guidance of occupational physicians concerned with the medical surveillance of atomic radiation workers (ARWs). Persons employed in industries where there is exposure to ionizing radiation should be screened medically for fitness for certain jobs before starting such work and at appropriate intervals while employed. This includes workers at uranium mines, mills and refineries, nuclear fuel fabrication plants, nuclear power plants and research facilities, and facilities using radionuclides in an industrial setting. An important purpose of medical surveillance is to ensure that workers are fit both physically and psychologically to undertake the tasks they may be called upon to perform.

1747 (INFO–0405) **Estimation of lung tissue doses following exposure to low-LET radiation in the Canadian study of cancer following multiple fluoroscopies.** Howe, G.R.; Yaffe, M. Atomic Energy Control Board, Ottawa, ON (Canada). Feb 1992. 55p. Project 6.114.1 and 6.114.2. Order Number DE93603653. Source: OSTI; NTIS (US Sales Only); INIS.

Lung tissue doses from exposure to external low-LET radiation have been estimated for each year between 1930 and 1960 for 92,707 tuberculosis patients first treated in Canadian institutions between 1930 and 1952. Many of these patients received multiple chest fluoroscopies together with treatment by artificial pneumothorax, and thus accumulated doses up to 15.7 grays. The estimated doses have been used in a statistical analysis of lung cancer mortality between 1950 and 1987 occurring among 64,698 patients known to be alive at the start of 1950, and followed by linkage to the Canadian national mortality data base. There were substantial variations in the total cumulative lung tissue dose received by the cohort, with 2,490 individuals having doses in excess of 1.7 grays. A total of 1,156 lung cancer deaths was observed in the cohort, and these have been used to estimate relative risks. The most appropriate risk model appears to be a simple linear relative risk function, with an excess relative risk coefficient of 0.089 for an absorbed dose of 1 gray. This contrasts with estimates of relative risk based on the atomic bomb survivors study, for which the excess relative risk coefficient for males 20 years after the first exposure is estimated to be 0.64. The difference is statistically significant. It is postulated that fractionation and dose rate effectiveness factors may account for some of the discrepancy. (Modified author abstract) (14 refs., 20 tabs.).

1748 (INFO–0416) **Childhood leukemia around five nuclear facilities in Canada.** Elaguppillai, V. Atomic Energy Control Board, Ottawa, ON (Canada). May 1992. 5p. (CONF-9205118–: 2. international conference on effects of low-dose ionizing radiation, Bournemouth (United Kingdom), 18-20 May 1992). Order Number DE93603654. Source: OSTI; NTIS (US Sales Only); INIS.

As a result of public concern over the incidence of leukemia around the Sellafield nuclear fuel reprocessing plant, the Canadian Atomic Energy Control Board commissioned a study to test for similar clustering around licensed nuclear facilities in Ontario. In this study the incidence and mortality of leukemia among children up to the age of 14 years born within a radius of about 25 km from five different types of facilities were compared to the provincial average. The facilities considered were the Pickering Nuclear Generating Station, the Bruce Nuclear Power Development, the uranium conversion facility at Port Hope, the uranium mine and mill facilities in Elliot Lake, and the Chalk River Laboratories. The ratio of observed to expected childhood leukemias was around unity at the 95 percent confidence level, indicating that the occurrence of the disease is not significantly different from the provincial average. The sample size is not large enough to distinguish between a change occurrence and a true excess or deficit. (table).

1749 (INFO–0420) **Effects of microdistribution of tritium on dose calculations.** Prestwich, W.V.; Kwok, C.S.; Nunes, J. Atomic Energy Control Board, Ottawa, ON (Canada). Jun 1992. 63p. Order Number DE93603665. Source: OSTI; NTIS (US Sales Only); INIS.

Literature and data pertaining to the microdosimetry, relative biological effectiveness, subcellular distribution, organ uptake and retention for organically-bound tritium are reviewed. The quality factor for the electron degradation spectrum associated with the radiation field of tritium β-rays in water was calculated. The value was found to be $1.9 \pm .2$. A related experimental measure of quality with value $1.6 \pm .2$ and an estimate of 1.3 based on simulation studies are cited. The average value for relative biological effectiveness for a data base of 55 values was found to be $1.8 \pm .1$. The influence of reference radiation, in vivo versus in vitro methodologies, and the use of tritiated thymidine or tritiated water are discussed. A methodology designed to estimate the effects of subcellular distribution is described and a suitable parameter, the localization factor defined. Estimates of this factor are made for both nuclear-bound and organically-bound tritium. Values of 4 and 1.5 respectively are suggested. Organ uptake studies in rodents following long-term feeding of organically-bound tritium are compared. The tritium is found to be unequally distributed among the tissues studied. The highest specific activity occurs in liver, with the lowest in femur. The specific activity of tritium in tissue-free water slightly exceeds that of organically-bound tritium in liver. Retention studies reveal a three-component exponential decrease of organically-bound tritium. No discernible trends of the periods of the three components with specific organs could be established. Average values of the periods are $1.2 \pm .2$, 10 ± 2, and 65 ± 8 days. It is concluded that specific enhancement of radiobiological effectiveness due to incorporation of tritium in DNA does probably not occur. The radiotoxicological impact of organically-bound tritium could warrant the use of a radiation weighing factor between 2 and 3.

1750 (INFO–0421) **Comments on ICRP-60 rationale for dose limits for the pregnant worker.** Myers, D.K. Atomic Energy Control Board, Ottawa, ON (Canada). Jun 1992. 62p. Order Number DE93603686. Source: OSTI; NTIS (US Sales Only); INIS.

ICRP Publication 60 has recently recommended new dose limits for the radiation exposure of pregnant workers. These new dose limits for pregnant workers are more restrictive than the current limits in force in Canada. Recent presentations by Dr. R.H. Mole have faulted the arguments provided by ICRP as justification for reducing the previously recommended limits for pregnant radiation workers. The present paper provides a brief review of the development of the human conceptus, of the biological effects of low doses of radiation on the foetus, and discusses R.H. Mole's comments on ICRP-60. On the critical issues concerning the presence or absence of threshold doses for induction of specific biological endpoints, Dr. Mole and ICRP-60 appear to be in agreement. The basic disagreement between Dr. Mole and ICRP-60 seems to revolve around the philosophical question of whether dose limits should be based on quantitative risks to the foetus or whether dose limits to the pregnant worker should provide a standard of protection to the foetus which is broadly comparable with that provided for members of the general public. Further research is recommended on one of the topics raised by Dr. Mole, namely, foetal doses from radionuclides inhaled or ingested by the mother.

1754 (KAERI/RR–998/90) **A development of computer code for evaluating internal radiation dose through ingestion and inhalation pathways.** Lee, Jeong Ho (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Lee, Chang Woo; Choi, Yong Ho; Chun, Ki Jung; Kim, Kook Chan; Kim, Sang Bok; Kim, Jin Kyu. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jul 1991. 460p. (In Korean). Order Number DE93605612. Source: OSTI; NTIS (US Sales Only); INIS.

The computer codes were developed to evaluate internal radiation dose when radioactive isotopes released from nuclear facilities are taken through ingestion and inhalation pathways. Food chain models and relevant data base representing the agricultural and social environment of Korea are set up. An equilibrium model-KFOOD, which can deal with routine releases from a nuclear facility and a dynamic model-ECOREA, which is suitable for the description of acute radioactivity release following nuclear accident. (Author).

1755 (KAERI/RR–1045/91) **The probabilistic risk assessment due to indoor exposure to ^{222}Rn daughters in Korea.** Chang, S. Y. (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Ha, C. W.; Yoon, C. C.; Seo, K. W.; Kim, B. H.; Chung, D. Y.; Kim, R. I.; Kim, J. S. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1992. 115p. (In Korean). Order Number DE93605553. Source: OSTI; NTIS (US Sales Only); INIS.

A small radon chamber system was designed to experimentally analyze the behavior of radon daughters which are currently believed to be a dominant source of human exposure to natural radiation, to calibrate various radon detectors and to participate in the intercomparison of radon measurement, IAEA coordinated research program on 'Radon in the Humen Environment' in which KAERI participates. A computer program RADEQ(Radon Daughter Equilibrium) was developed to analyze the behaviours of radon daughters. Lung cancer rates in Korean males and females were derived from the 1989 Korean life table and annual statistics on death data. From these, the lifetime baseline risk of lung cancer mortality among Koreans was mathematically estimated, and the excess lung cancer risk, attributable to indoor exposure to the radon daughters was estimated for the first time in Korea from the excess risk coefficient per radon daughters exposure(WLM) by using a modified relative risk projection model for stochastic effect of ionizing radiation. (Author).

1756 (KAERI/RR–1070/91) **The development of dose evaluation program for personnel radiation dosimetry.** Yoon, Suk Chul (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Ha, Chung Woo; Lee, Tae Young; Kim, Jang Lyul; Kim, Bong Hwan; Jeong, Deok Yeon; Lee, Ki Chang; Kim, Chang Kyung. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 114p. (In Korean). Order Number DE93605611. Source: OSTI; NTIS (US Sales Only); INIS.

The final goal of this three-year project is to develop a standard dose evaluation program of personnel dosimetry and to take part in the NVLAP of the NIST in the U.S.A. This will provide KAERI with the transfer of acquired high technology to Korea nuclear industry. The main purpose of the study in the first year was to develop the related S/W techniques and comply with the ANSI N13.11 test categories(I,II,III,and IV). We analysed the characters of ANSI N13.11 and made the counter-measure for this. Half Value Layer and Spectroscopy Technique were used for the measurements of effective X-ray energies. The design requirement of TLD badge system and the dose algorithm were analysed. And the calculation of dose equivalents at interest depths of ICRU Sphere and Water Cube Phantom was performed by using MCNP code. Theoretical computation for the scattering correction factors of the detectors in the KAERI neutron calibration room was done using MCNP code and compared with other results. A Precision Long Counter as a second standard device and a Shadow Cone were specially designed and constructed. (Author).

1757 (LBL–32179) **Estimating the distribution of lifetime cumulative radon exposures for California residents: A brief summary.** Liu, K.S. (California Dept. of Public Health, Berkeley, CA (United States). Air and Industrial Hygiene Lab.); Chang, Y.L.; Hayward, S.B.; Gadgil, A.J.; Nero, A.V. Jr. Lawrence Berkeley Lab., CA (United States). Apr 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-910905–4: 5. international symposium on the natural radiation environment, Salzburg (Austria), 22-28 Sep 1991). Order Number DE93000578. Source: OSTI; NTIS; GPO Dep.

We have used data on residential radon concentrations in California, together with information on California residents' moving histories and time-activity patterns, to estimate the distribution of lifetime cumulative exposures to radon 222. This distribution was constructed using Monte Carlo techniques to simulate the lifetime occupancy histories – and associated radon exposures – of 10,000 California residents. For standard male and female lifespans, the

simulation sampled from transition probability matrices representing changes of residence within and between six regions of California, as well as into and out of the other United States, and then sampled from the appropriate regional (or national) distribution of indoor concentrations. The resulting distribution of lifetime cumulative exposures has a significantly narrower relative width than the distribution of California indoor concentrations, with only a small fraction – less than 0.2% – of the population having lifetime exposures equivalent to living during their lifetimes in a single home with a radon concentration of 148 Bq/m^3 or more.

1758 (NKS–91-8) **The Nordic Nuclear Safety program 1990-1993: Status report for the first half-year 1991.** Nordisk Kernesikkerhedsforskning, Roskilde (Denmark). Aug 1991. 53p. (In Danish, Swedish, Norwegian, English). Order Number DE93603683. Source: OSTI; NTIS; INIS.

The status report concerning the Nordic Nuclear Safety Programme for 1990-1993 contains a summary of the current situation regarding research projects, presented by the four coordinators, and a survey of the related economy. It is stated that all seventeen projects are running satisfactorily and a number of working descriptions have been published. Project leaders work with contracts with consultant firms, research organizations and individuals, contact meetings including lectures and discussions, mini-seminars where participants actually work at the same time, coordination of nationally financed research projects and individual contributions. Problems related to a certain lack of qualified persons for whom it is possible to coordinate this Nordic work with their daily responsibilities have led to delays in relation to the working plans and this has resulted in the fact that not all the grants have been utilized as yet. Sub-programmes are dealt with individually, and lists of publications are presented. (AB) (10 refs.).

1759 (PNL–7877-Rev.1) **National Radiobiology Archives Distributed Access User's Manual, Version 1.1: Revision 1.** Smith, S.K.; Prather, J.C.; Ligotke, E.K.; Watson, C.R. Pacific Northwest Lab., Richland, WA (United States). Jun 1992. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93002438. Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020; GPO Dep.

This supplement to the NRA Distributed Access User's manual (PNL-7877), November 1991, describes installation and use of Version 1.1 of the software package; this is not a replacement of the previous manual. Version 1.1 of the NRA Distributed Access Package is a maintenance release. It eliminates several bugs, and includes a few new features which are described in this manual. Although the appearance of some menu screens has changed, we are confident that the Version 1.0 User's Manual will provide an adequate introduction to the system. Users who are unfamiliar with Version 1.0 may wish to experiment with that version before moving on to Version 1.1.

1760 (SAND–91-2603C) **Application of RADTRAN to estimation of doses to persons in enclosed spaces.** Neuhauser, K.S. Sandia National Labs., Albuquerque, NM (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (TTC–1121;CONF-920905–32: 10. international symposium on the packaging and transportation of radioactive materials: PATRAM '92, Yokohama (Japan), 13-18 Sep 1992). Order Number DE93000758. Source: OSTI; NTIS; INIS; GPO Dep.

The RADTRAN computer code for transportation risk analysis can be used to estimate doses to persons in enclosed volumes. This application was developed in response to a need to examine consequences of a hypothetical container leak during accident-free transportation by cargo air. The original problem addressed tritium containers, but the method can be applied to any gaseous or suspended particulate material potentially released in an airplane or other enclosed area (e.g., warehouse) under accident-free conditions. Such leakage can occur during shipment of any radioactive gas or material with a gaseous phase. Atmospheric dispersion is normally modeled in RADTRAN as a series of downwind isopleths each of which is assigned a dilution factor (also known as time-integrated concentration or X/Q value). These values are located in look-up tables in RADTRAN and are normally taken from externally performed Gaussian dispersion calculations. The dilution factors are used to estimate inhalation dose to persons in the specified downwind areas.

1761 (WSRC-MS–92-212) **Radiological risk comparison guidelines.** Hallinan, E.J. (Westinghouse Savannah River Co., Aiken, SC (United States)); Muhlestein, L.D.; Brown, L.F.; Yoder, R.E. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9208117–11: 1992 Energy Facility Contractors Group (EFCOG) safety analysis workshop, Salt Lake City, UT (United States), 11-13 Aug 1992). Order Number DE92040204. Source: OSTI; NTIS; INIS; GPO Dep.

An important aspect of DOE safety analyses is estimating potential accident risk. The estimates are used to: determine if additional controls are needed, identify Safety Class Items, and demonstrate adequate risk reduction. Thus, guidelines are needed to measure comparative risks. The Westinghouse M&O Nuclear Facility Safety Committee and the Safety Envelope Working Group have developed radiological risk guidelines for comparing the risks from individual accident analyses. These guidelines were prepared under contract with the US Department of Energy. These guidelines are based on historical DOE guidelines and current requirements, and satisfy DOE and technical community proposals. for goals that demonstrate acceptable risk. The guidelines consist of a frequency versus consequence curve for credible accidents. Offsite and onsite guidelines are presented. The offsite risk acceptance guidelines are presented in Figure 1. The guidelines are nearly isorisk for anticipated events where impacts are chronic, and provide additional reduction for unlikely events where impacts may be acute and risk uncertainties may be significant. The guidelines are applied to individual release accident scenarios where a discrete frequency and consequence has been estimated. The guideline curves are not to be used for total risk assessments. Common cause events are taken into consideration only for an individual facility. Frequencies outside the guideline range are considered to be local site option (analyst judgement) as far as assessments of risk acceptance are concerned. If the curve is exceeded, then options include either a more detailed analysis or imposing additional preventive or mitigative features. Another presentation discusses implementation in detail. Additional work is needed to provide risk comparison guidelines for releases from multiple facilities and for toxic releases.

1762 (CONF-9208143–1) **Alkylation damage repair in mammalian genomes.** Mitra, S. (Texas Univ. Medical Branch, Galveston, TX (United States). Sealy Center for Molecular Science); Roy, R.; Kim, N.K.; Tano, K.; Ibeanu, G.C.; Dunn, W.C. Oak Ridge National Lab., TN (United States). [1992]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Alfred Benzon symposium 35 on DNA repair mechanism; Copenhagen (Denmark); 8-13 Aug 1992. Order Number DE93001208. Source: OSTI; NTIS; GPO Dep.

The repair of O^6 -alkylguanine in DNA involves only O^6 -methyltransferase (MGMT) while the repair of N-alkylpurines requires multiple proteins including N-methylpurine-DNA glycosylase (MPG). While the biochemical properties human and mouse MGMTs are very similar, the mouse MPG removes 7-methylguanine more efficiently than the human protein. An increased level of MGMT, without a change in the level of MPG associated with gene amplification, was observed in a mouse cell line resistant to 2-chloroethyl-N-nitrosourea. In contrast, no correlation was observed between MPG level and resistance to methyl methanesulfonate in Chinese hamster ovary (CHO) cells. This result suggests a protein other than MPG limits the repair rate of N-alkylpurine in CHO cells.

1763 (DOE/ER/60674–5) **Base sequence effects on interactions of aromatic mutagens with DNA: Progress report, September 1, 1991–August 31, 1992.** Geacintov, N.E. New York Univ., NY (United States). Dept. of Chemistry. 30 Sep 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract FG02-88ER60674. Order Number DE93001568. Source: OSTI; NTIS; GPO Dep.

The chemical binding of bulky, mutagenic and carcinogenic polynuclear aromatic compounds to certain base-sequences in genomic DNA is known to inhibit DNA replication, and to induce mutations and cancer. In particular, sequences that contain multiple consecutive guanines appear to be hot spots of mutation. The objectives of this research are to determine how the base sequence around the mutagen-modified target bases influences the local DNA conformation and gives rise to mispairing of bases, or deletions, near the lesion. Oligonucleotides containing one, two, or three guanines were synthesized and chemically reacted with the mutagen anti-7,8-dihydroxy-9,10-epoxy-benzo[a]pyrene (BPDE), one of the most mutagenic and tumorigenic metabolites of benzo[a]pyrene. Adducts are formed in which only one of the guanines is modified by trans or cis addition to the exocyclic amino group. The BPDE-oligonucleotides are separated chromatographically, and the site of modification is established by Maxam-Gilbert high resolution gel electrophoresis techniques. The thermodynamic properties of duplexes using complementary, or partially complementary strands were examined. In the latter, the base opposite the modified guanine was varied in order to investigate the probability of mispairing of the modified G with A,T and G. The successful synthesis of stereospecific and site-specific mutagen-oligonucleotide adducts opens new possibilities for correlating adduct structure-biological activity relationships, and thus lead to a better understanding of base-sequence effects in mutagenesis induced by energy-related bulky polynuclear aromatic chemicals.

1764 (KAERI/RR–1055/91) **Biomonitoring of uranium and heavy metal pollution.** Lee, Kang Suk (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Chun, Ki Jung; Kim, Kug Chan; Choi, Yong Ho; Kim, Jin Kyu; Kim, In Gyu; Park, Hyo Kook; Lee, Keun Bae. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1992. 65p. (In Korean). Order Number DE93605445. Source: OSTI; NTIS (US Sales Only); INIS.

New protein was induced by intraperitoneal injection of uranium. It was purified from liver of carp to which uranium had been at administered 1.5mg/kg fresh for 6 days. The protein was separated by sephadex G-100 and AEAE-Sepharose and characteristics of the metallothionein were not shown by it. It has a molecular weight of 40 KD. Cytosol type superoxide dismutase in carp testis has at least three electrophoretically different forms. Cyanide inhibits the activity of cytosol type superoxide dismutase. When it stored in solution, superoxide dismutase changed into polymeric form which retain its activity. It has been purified by gel permeation, chloroform-ethanol precipitation, and ion exchange column chromatography. (Author).

1765 (KFK–5040) **Progress report on research and development work 1991 of the Institute of Genetics and Toxicology of Fissionable Materials, Karlsruhe Nuclear Research Center.** Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Genetik und Toxikologie von Spaltstoffen. Mar 1991. 26p. (In German). Order Number DE93720184. Source: OSTI; NTIS (US Sales Only); INIS.

The present annual report describes the results of research work done by the Institute of Genetics and Toxicology of Fissionable Materials (IGT) in 1991. The following eight subjects were dealt with: genetic repair; genetic regulation; biological carcinogenesis; molecular genetics of eukaryontic genes; genetic mouse models for human illnesses; radiation toxicology of actinides; molecular and cellular environmental toxicology, and in vivo fractionation and speciation of actinides. (MG).

1766 (KFK-PEF–90) **Reflection spectra of leaves and needles as basis for the physiological evaluation of tree damage.** Buschmann, C. (Karlsruhe Univ. (T.H.) (Germany). Botanisches Inst. 2); Nagel, E. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Europaeisches Forschungszentrum fuer Massnahmen zur Luftreinhaltung (PEF). Jan 1992. 190p. (In German). Contract PEF 87/005/1A;PEF 89/007/1A. Order Number DE93720218. Source: OSTI; NTIS (US Sales Only).

This project aimed to examine whether from reflection signals measured in remote sensing besides discolouring also physiological damages can be detected. By means of a spectrometer (VIRAF) newly developed by us from ca. 2000 leaf samples in each case were measured: Reflection and absorption spectra (400 - 800 nm) as well as fluorescence spectra (650 - 800 nm) and Kautsky-induction-kinetics (at 680 nm). From the reflection spectra the chromaticity coordinates according to CIE 1931 were calculated and the samples were documented by means of a computer-aided video-image-analysis-system. The state of health of a plant can best be determined, if the chlorophyll content of the leaves changes. This is most clearly shown in the shift of the inflection point of the 'red edge' of the reflection spectrum. The composition of the pigment-protein-complexes, the leaf tissue structure and the physiological activity change the reflection to a minor extend. Out of the physiological parameters the chlorophyll fluorescence (detected together with the reflection) affects the reflection most strongly. From the examinations recommendations for practical remote sensing are deduced. (orig.) With 96 figs., 26 tabs., 181 refs.

5604 Other Environmental Pollutant Effects

1767 (ANL/CP–77257) **Effects of maglev-spectrum magnetic field exposure on CEM T-lymphoblastoid human cell growth and differentiation.** Groh, K.R.; Chubb, C.B.; Collart, F.R.; Huberman, E. Argonne National Lab., IL (United States). [1992]. 9p. Sponsored by Department of Transportation, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920630–2: 1. world congress for electricity and magnetism in biology and medicine, Orlando, FL (United States), 14-29 Jun 1992). Order Number DE92041134. Source: OSTI; NTIS; GPO Dep.

Exposure to magnetic fields similar to those produced by maglev vehicles (combined ac and dc components) was studied for the ability to alter cell growth and chemically induced cellular differentiation processes in cultured human CEM Tlymphoblastoid leukemia cells. A series of continuous and intermittent magnetic field (MF) exposures for varying lengths of time were tested at intensities up to 7-fold greater than that produced by the German TR07 maglev vehicle. Phorbol 12-myristate 13-acetate or mycophenolic acid were used to induce cell differentiation. Changes in cell number, morphology, and fluorescence expression of antigenic markers of differentiation were monitored. The results indicated that maglev-spectrum magnetic field exposures up to 2 gauss had little effect on culture growth or chemically induced cellular differentiation when exposed to maglev-spectrum magnetic fields compared to chemically treated but MF-unexposed controls.

1768 (DOE/BP–92041322) **Seasonal patterns of melatonin, cortisol, and progesterone secretion in female lambs raised beneath a 500-kV transmission lines.** Lee, J.M. Jr. USDOE Bonneville Power Administration, Portland, OR (United States). Jun 1992. 194p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92041322. Source: OSTI; NTIS; GPO Dep.

Thesis submitted by J.M. Lee Jr. to Portland State University, OR.

Although several kinds of biological effects of electric and magnetic fields have been reported from laboratory studies, few have been independently replicated. When this study was being planned, the suppression of nighttime melatonin in rodents was thought to represent one of the strongest known effects of these fields. The effect had been replicated by a single laboratory for 60-Hz electric fields, and by multiple laboratories for d-c magnetic fields. The primary objective of this study was to determine whether the effect of electric and magnetic fields on melatonin would also occur in sheep exposed to a high voltage transmission line. The specific hypothesis tested by this experiment was as follows: The electrical environment produced by a 60-Hz, 500-kV transmission line causes a depression in nocturnal melatonin in chronically exposed female lambs. This may mimic effects of pinealectomy or constant long-day photoperiods, thus delaying the onset of reproductive cycles. Results of the study do not provide evidence to support the hypothesis. Melatonin concentrations in the sheep exposed to the transmission line showed the normal pattern of low daytime and high nighttime serum levels. As compared to the control group, there were no statistically significant group differences in the mean amplitude, phase, or duration of the nighttime melatonin elevation.

1769 (DOE/RA/50219–41) **Investigation of effects of 60-Hz electric and magnetic fields on operant and social behavior and on the neuroendocrine system of nonhuman primates: Quarterly report, Scan and activity data for experiments 4 and 4A, [July 1, 1992–September 30, 1992].** Smith, H.D. Southwest Research Inst., San Antonio, TX (United States). Dept. of Biosciences and Bioengineering. 2 Nov 1992. 130p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-80RA50219. Order Number DE93003124. Source: OSTI; NTIS; GPO Dep.

The objective of this program is to investigate behavioral and neuroendocrine effects associated with exposure to 60-Hz electric and magnetic fields (E/MF), using the baboon surrogate for the human. Baboon social groups were scanned and electronically monitored during Experiments IV and IVA. The social scan, form that the technicians used to identify baboon locations and proximity to other baboons: was used to gain a simple snapshot of the position of the baboons in their cage. The scans were taken hourly every morning and evening for a total of eight scans per side per day. This report covers in detail the scan and activity data-gathering process. A set of appendices is attached which include printouts of the data sets and adjunct material pertinent to interpreting the data. The supporting material is comprised of calendars and listings of major events that occurred during the scan and activity data collection.

1770 (NEI-DK–974) **Traffic at Louisiana: Contributions to the conference.** Hovedstadsraadets Trafikselskab, Valby (Denmark); Trafikministeriet, Copenhagen (Denmark). 1992 96p. (In Danish, Swedish, Norwegian). (CONF-9204202–: Conference on traffic, Humlebaek (Denmark), 10 Apr 1992). Order Number DE93721449. Source: OSTI; NTIS.

A collection of papers contributed to an international conference on traffic management. The overall aim of the conference was to initiate a dialogue beween politicians, researchers and specialists that work within the fields of, or related to, traffic, energy and the environment in order to find solutions to environmental and other problems related to the transport sector, especially in urban areas. (AB).

1771 (NEI-DK–974, pp. 15-19) **Strasbourg's transport policy.** Trautmann, C. Hovedstadsraadets Trafikselskab, Valby (Denmark); Trafikministeriet, Copenhagen (Denmark). 1992. 96p. (In Danish). (CONF-9204202–: Conference on traffic, Humlebaek (Denmark), 10 Apr 1992). In *Traffic at Louisiana: Contributions to the conference.* Order Number DE93721449. Source: OSTI; NTIS.

Strasbourg has undergone extensive development in the field of transport. The main arteries that used to cross Strasbourg's city centre have been cut off. This decision is part of a new transport policy, in which efforts are made to facilitate transport while at the same time allowing for the fact that a city's transport policy has a great influence on the model according to which the city develops. A model based on innovation and on the present transport situation, and one which does away with the old saying that a car is the most perfect, formal and real expression of individual freedom for getting from place to place. In transport terms, the cities of Europe are not at a crossroads where they have to prepare seriously for changes. The future development pattern of our cities will be marked by the measures which for environmental reasons have to be taken in the transport sector. The increasing significance of public transport in this type of city pattern means that urban planning and transport planning need to be integrated, so as to make better room for the fight against trends towards urban decay, dissolution of urban structures and degradation of the life than can be lived in a city. (au).

1772 (NEI-DK–974, pp. 21-25) **Quality of life, environment and transport.** Kickbusch, I. (Livsstil og sundhed, WHO-kontoret (DK)). Hovedstadsraadets Trafikselskab, Valby (Denmark); Trafikministeriet, Copenhagen (Denmark). 1992. 96p. (In Danish). (CONF-9204202–: Conference on traffic, Humlebaek (Denmark), 10 Apr 1992). In *Traffic at Louisiana: Contributions to the conference.* Order Number DE93721449. Source: OSTI; NTIS.

Bearing their global responsibility in mind, European cities will have to introduce and agree upon new forms of social and environmental attitudes, which comprise quality of life, sustainability and human health. Unfortunately, recent surveys have indicated that the Maastrict agreement will lead to increased environmental damage and problems. The solution does not only lie in finding better technological solutions to enable "business as usual" to continue, but also to find an answer to the question "How do we want to live?". In the field of transport the WHO group /EURO core group that consists of 30 Healthy Cities has adopted guidelines for the development of a sound transport policy for urban areas. The guidelines have been made on the basis of an examination of the effects of urban transport on health and the environment - not only with regard to car transport and such effects of it as noise and air pollution, but also in terms of accidents, where most victims are vulnerable groups such as children and elderly people. These guidelines are outlined in more detail in the draft. (au).

1773 (WSRC-RP–92-240) **Response of fish to different simulated rates of water temperature increase.** Wike, L.D.; Tuckfield, R.C. Westinghouse Savannah River Co., Aiken, SC (United States). Aug 1992. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93000487. Source: OSTI; NTIS; GPO Dep.

We initiated this study to define the limits of effluent-temperature rate increases during reactor restart, which will help minimize fish kills. We constructed an apparatus for exposing fish to various temperature-increase regimens and conducted two experiments based on information from system tests and scoping runs. In the rate experiment, we acclimated the fish to 20°C, and then raised the temperature to 40°C at varying rates. Because scoping runs and literature suggested that acclimation temperature may affect temperature-related mortality, we conducted an acclimation experiment. We acclimated the fish to various temperatures, then raised the temperatures to 39–40°C at a rate of 2°C every 12 hours. Based on the analysis of the data, we recommend temperature-increase rates during reactor restart of 2.5°C every nine hours if ambient water temperatures are over 20°C. If water temperatures are at or below 20°C, we recommend temperature-increase rates of 2.5°C every 12 hours. No regulation of temperature is required after effluent temperatures reach 40°C. We recommend further studies, including expanded testing with the simulation system and behavioral and bioenergetic investigations that may further refine acceptable rates of effluent-temperature increases.

1774 (DOE/ER/13414–T1) **Activity composition relationships in silicate melts: Final report.** Glazner, A.F. North Carolina Univ., Chapel Hill, NC (United States). [1990]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-85ER13414. Order Number DE93000931. Source: OSTI; NTIS; GPO Dep.

Equipment progress include furnace construction and electron microprobe installation. The following studies are underway: phase equilibria along basalt-rhyolite mixing line (olivine crystallization from natural silicic andensites, distribution of Fe and Mg between olivine and liquid, dist. of Ca and Na between plagioclase and liquid), enthalpy-composition relations in magmas (bulk heat capacity of alkali basalt), density model for magma ascent and contamination, thermobarometry in igneous systems (olivine/plagioclase phenocryst growth in Quat. basalt), high-pressure phase equilibria of alkali basalt, basalt-quartz mixing experiments, phase equilibria of East African basalts, and granitic minerals in mafic magma. (DLC)

1775 (DOE/ER/14079–19) **Migration error in transversely isotropic media with linear velocity variation in depth.** Larner, K.; Cohen, J.K. Colorado School of Mines, Golden, CO (United States). Center for Wave Phenomena. [1992]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER14079. (CWP–118R). Order Number DE93000386. Source: OSTI; NTIS; GPO Dep.

Given the sensitivity of imaging accuracy to the velocity used in migration, migration founded (as in practice) on the erroneous assumption that a medium is isotropic can be expected to be inaccurate for steep reflectors. Here, we estimate errors in interpreted reflection time and lateral position as a function of reflector dip for transversely isotropic models in which the axis of symmetry is vertical and the medium velocity varies linearly with depth. We limit consideration to media in which ratios of the various elastic moduli are independent of depth. Tests with reflector dips up to 120 degrees on a variety of anisotropic media show errors that axe tens of wavelengths for dips beyond 90 degrees when the medium (unrealistically) is homogeneous. For a given anisotropy, the errors are smaller for inhomogeneous media; the larger the velocity gradient, the smaller the errors. For gradients that are representative of the subsurface, lateral-position errors tend to be minor for dips less than about 60 degrees, growing to two to five wavelengths as dip passes beyond 90 degrees. These errors depend on reflector depth and average velocity to the reflector only through their ratio, i.e., migrated reflection time. Migration error, which is found to be unrelated to the ratio of horizontal to vertical velocity, is such that reflections with later migrated reflection times tend to be more severely over-migrated than are those with earlier ones. Over a large range of dips, migration errors that arise when anisotropy is ignored but inhomogeneity is honored tend to be considerably smaller than those encountered when inhomogeneity is ignored in migrating data from isotropic, inhomogeneous media.

1776 (DOE/ER/14079–20) **Dip-moveout error in transversely isotropic media with linear velocity variation in depth.** Larner, K. Colorado School of Mines, Golden, CO (United States). Center for Wave Phenomena. [1992]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER14079. (CWP–119R). Order Number DE93000640. Source: OSTI; NTIS; GPO Dep.

Levin (1990) modeled the moveout, within Common-midpoint (CMP) gathers, of reflections from plane-dipping reflectors beneath homogeneous, transversely isotropic media. For some media, when the axis of symmetry for the anisotropy was vertical, he found departures in stacking velocity from predictions based upon the familiar cosine-of-dip correction for isotropic media. Here, I do similar tests, again with transversely isotropic models with vertical axis of symmetry, but now allowing the medium velocity to vary linearly with depth. Results for the same four anisotropic media studied by Levin show behavior of dip-corrected stacking velocity with reflector dip that, for all velocity gradients considered, differs little from that for the counterpart homogeneous media. As with isotropic media, traveltimes in an inhomogeneous, transversely isotropic medium can be modeled adequately with a homogeneous model with vertical velocity equal to the vertical rms velocity of the inhomogeneous medium. In practice, dip-moveout (DMO) is based on the assumption that either the medium is homogeneous or its velocity varies with depth, but in both cases isotropy is assumed. It turns out that for only one of the transversely isotropic media considered here –shale-limestone – would v(z) DMO fail to give an adequate correction within CMP gathers. For the shale-limestone, fortuitously the constant-velocity DMO gives a better moveout correction than does the v(z) DMO.

1777 (DOE/ER/14153–2) **Reactive fluid flow models and applications to diagenesis, mineral deposits and crustal rocks: Progress report.** Lasaga, A.C.; Rye, D.M. Yale Univ., New Haven, CT (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER14153. Order Number DE93002097. Source: OSTI; NTIS; GPO Dep.

This project is obtaining new results and developing new techniques along three directions: (a) experimental studies of water-rock reactions (b) theoretical modeling of coupled fluid flow-chemical reactions and (c) isotopic measurements of both regional isotopic compositions as well as isotopic zoning within individual mineral grains. An important part of the project is the integration of all three approaches into a concerted effort aimed at new understanding of the behavior of fluids and their chemical reactions with minerals in the crust. The experimental work pioneered in our laboratories has produced several startling results on the kinetic rate laws of silicate-water reactions. The approach to equilibrium has been shown to follow a non-linear path in rate constant-free energy space. This behavior is quite distinct from most work done by geochemists on modeling silicate behavior in diagenesis, weathering, hydrothermal systems or environmental models. The work to date has involved albite, kaolinite and gibbsite, which together with silica would comprise a kinetic "granite system prototype". The theoretical modeling has produced a state-of-the-art computer code that can efficiently handle dozens of chemical species, many mineral reactions and variations of fluid flow properties and temperature in both one and two dimensions. In addition the code can now treat oxidation-reduction reactions and isotopic exchange between fluids and minerals. The main thrust of the theoretical modeling has been to develop further the differences between equilibrium, steady state, and non-steady-state behavior of the chemical evolution of open fluid-rock systems. These differences have not been fully appreciated in previous models.

1778 (LBL–32195) **Brief guide to the MINC-method for modeling flow and transport in fractured media.** Pruess, K. Lawrence Berkeley Lab., CA (United States). May 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93001520. Source: OSTI; NTIS; GPO Dep.

MINC stands for "Multiple INteracting continua." It is an approximate method for modeling fluid and heat flow in fractured- porous media, developed by Pruess and Narasimhan (1982, 1985) at the Lawrence Berkeley Laboratory. The method is applicable to flow processes in which an important aspect is the exchange of fluid, heat, or chemical species between fractures and unfractured rock. Examples include production and injection operations in fractured geothermal reservoirs, water-flooding, steamflooding, and other methods for enhanced oil recovery from fractured reservoirs, as well as chemical transport and contaminant migration in fractured rock. MINC can only be applied to media in which the fractures are sufficiently well connected so that a continuum treatment of flow in the fracture network can be made.

1779 (NEI-DK–966) **Acquisition project: Final report, part 1.** Vejlby Hansen, K. Oedegaard og Danneskiold-Samsoee ApS, Copenhagen (Denmark). Sep 1991 45p. Contract ENS-1313/90-0002. Order Number DE93721412. Source: OSTI; NTIS.

EFP-90.

An introduction to marine seismic acquisition which mainly describes the acquisition geometry with special attention to the CMP (Common MidPoint)-gather geometry. The moveout correction, which is used to correct the recorded signals to zero offset signals, is derived for several subsurface models and the data sorting and stacking are also deduced. The CMP-gather configuration is of interest due to the improvement of the signal-to-noise ratio of the recorded data and the possiblity of subsurface layer velocity estimation. It is concluded that to describe arbitrary subsurface models ray tracing should be used in relation to the moveout correction and stacking. A simple ray tracing principle is deduced. The assumed subsurface model is characterized by homogeneous layers having constant velocity and straight lines as interfaces. The difference between the original and the new approach is that the previous one assumes that the optical acquisition parameters are a point in a mult-dimensional space while the new approach assumes that the optimal parameter values are intervals and only finds the limits of the intervals. It is based on accuracy of estimated layer velocities, signal-to-noise ratio and separation of the receiver ghost. The required layer velocity accuracy is translated by use of a two dimensional sampling to a required offset and hydrophone group distance. The required signal-to-noise ratio is used to determine the necessary number of folds. The elimination of the receiver ghost is used to determine the required depth of the streamer from the surface. (AB).

1780 (NEI-DK–967) **Acquisition project: Final report, part 2.** Bolding Rasmussen, K. Oedegaard og Danneskiold-Samsoee ApS, Copenhagen (Denmark). May 1992 22p. Contract ENS-1313/90-0002. Order Number DE93721413. Source: OSTI; NTIS.

EFP-90.

A feasible and sound approach to optimization of reflection seismic acquisition parameters is developed. A computer programme is developed which can assist in using this approach. Given the desired information contents in the data, measured by the so-called data quality paramaters, the computer program calculates the minimum required acquisition parameters. The approach is based entirely on mathematical models. This means that it is reasonable to expect that the approach will lead to usable acquisition parameter setups also in new exploration areas. The approach is based on closed form equations and a fully integrated ray tracer but it is simple to extend it with more accurate relations, e.g. a full wave equation based forward modelling. (Author).

1785 (IC–92/143) **Multiparametric quantum symplectic phase space.** Parashar, P. (International Centre for Theoretical Physics, Trieste (Italy)); Soni, S.K. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 11p. Order Number DE93604081. Source: OSTI; NTIS (US Sales Only); INIS.

We formulate a consistent multiparametric differential calculus on the quadratic coordinate algebra of the quantum vector space and use this as a tool to obtain a deformation of the associated symplectic phase space involving n(n-1)/2+1 deformation parameters. A consistent calculus on the relation subspace is also constructed. This is achieved with the help of a restricted ansatz and solving the consistency conditions to directly arrive at the main commutation structures without any reference to the R-matrix. However, the non-standard R-matrices for $GL_{r,s|}(n)$ and $Sp_{r,s|}(2n)$ can be easily read off from the commutation relations involving coordinates and derivatives. (author). 9 refs.

1786 (IC–92/158) **In what sense the canonical perturbation theory is gauge-invariant.** Chen, C.Y. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 11p. Order Number DE93604082. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that the time-dependent canonical perturbation theory in classical mechanics has unsatisfactory features when dealing with electromagnetic perturbed fields (the perturbed vector potential A-tilde $\neq 0$). As a numerical apparatus, the theory relates to gauge-dependent vectors larger than expected. As an analytic apparatus, the theory is involved in unphysical concepts and yields inherently non-gauge-invariant formalisms. By defining the root cause of the problem, an alternative approach is accordingly introduced. (author). 8 refs, 2 figs.

1787 (IC–92/169) **Formulation of wave mechanics without the Planck constant (h/2π).** Barut, A.O. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 4p. Order Number DE93604083. Source: OSTI; NTIS (US Sales Only); INIS.

Quantum mechanics can be formulated without the parameters (h/2π), m and e as a pure "wave theory" in terms of the frequencies alone. This is more directly related to experiments where one measures frequency differences rather than energies. Different quantum systems are then characterized by an intrinsic proper frequency ω_0. (author). 3 refs.

1788 (IC–92/172) **The Hermite-like description of two-magnon eigenvectors of 1D Heisenberg Hamiltonian with elliptic exchange is complete.** Inozemtsev, V.I. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 6p. Order Number DE93606029. Source: OSTI; NTIS (US Sales Only); INIS.

The problem of describing all N(N-1)/2 states in two-magnon sector of 1D periodic S = 1/2 chain with the Hamiltonian $H = -1/2\Sigma^{N}_{j,l}\rho(j - l)(\sigma_j\sigma_l-1)/2$ of spin interaction via elliptic Weierstrass ρ function is investigated. It is proved that the set of eigenvectors having Hermite-like form is complete. (author). 9 refs.

1795 (INP–1538/PH) **On the new notion of mass in classical mechanics.** Horzela, A. (Institute of Nuclear Physics, Cracow (Poland)); Kapuscik, E.; Kempczynski, J. Institute of Nuclear Physics, Cracow (Poland). Jan 1991. 8p. Order Number DE93604090. Source: OSTI; NTIS (US Sales Only); INIS.

A new concept of mass connected with the Galilean transformation rules of momenta and energy is introduced. It is shown that the Galilean mass does not have to be equal to the inertial mass of a particle. (author).

1796 (IYaF–91-83) **Chaotic quantum systems.** Chirikov, B.V. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 58p. Order Number DE93606030. Source: OSTI; NTIS (US Sales Only); INIS.

Lecture presented to 10. International Congress on Mathematical Physics, Leipzig, 1991.

The overview of recent developments in the theory of quantum chaos is presented with the special emphasis on a number of unsolved problems and current apparent contradictions. The relation between dynamical quantum chaos and statistical random matrix theory is discussed. 97 refs.

1797 (IYaF–91-97) **Scaling properties of localized quantum chaos.** Izrailev, F.M. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 23p. Order Number DE93606031. Source: OSTI; NTIS (US Sales Only); INIS.

Statistical properties of spectra and eigenfunctions are studied for the model of quantum chaos in the presence of dynamical localization. The main attention is paid to the scaling properties of localization length and level spacing distribution in the intermediate region between Poissonian and Wigner-Dyson statistics. It is shown that main features of such localized quantum chaos are well described by the introduced ensemble of band random matrices. 28 refs.; 7 figs.

1798 (JINR-D–2-91-436) **Modern approach to relativity theory (radar formulation).** Strel'tsov, V.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1991. 7p. Order Number DE93606032. Source: OSTI; NTIS (US Sales Only); INIS.

The main peculiarities of the radar formulation of the relativity theory are presented. This formulation operates with the retarded (light) distances and relativistic or radar length introduced on their basis. 21 refs.; 1 tab.

1799 (JINR-E–2-90-550) **Quantum mechanics of toroidal anions.** Afanas'ev, G.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1990. 22p. Order Number DE93606033. Source: OSTI; NTIS (US Sales Only); INIS.

We consider a toroidal solenoid with an electric charge attached to it. It turns out that statistical properties of the wave function describing interacting toroidal anions depend on both their relative position and orientation. The influence of the particular gauge choice on the exchange properties of the wave function is studied. 30 refs.; 6 figs.

1800 (JINR-E–2-91-133) **On two-dimensional quasiclassics.** Balandin, M.P.; Zastavenko, L.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 11p. Order Number DE93606034. Source: OSTI; NTIS (US Sales Only); INIS.

Quasiclassical limit of the two-dimensional Schroedinger equation is studied. Potential is supposed to weakly depend on the azimuthal angle. Behaviour of the quasiclassical wave function in a vicinity of turning curve is considered. 5 refs.

1801 (JINR-E–2-91-312) **Numerical investigation of Tonomura experiments.** Afanas'ev, G.N.; Shilov, V.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 12p. Order Number DE93606035. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to proc. R. Soc. London, Ser. A Math. Phys.

The quantitative theoretical analysis of Tonomura experiments testing the existence of the Aharonov-Bohm effect is given. The intensities of scattered electrons are computed for different values of the magnetic flux and positions of the observation plane. 24 refs.; 10 figs.

1802 (JINR-E–2-91-462) **Phase space representations for spin 2.** Polubarinov, I.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 24p. Order Number DE93606036. Source: OSTI; NTIS (US Sales Only); INIS.

Phase space representations for spin 2 are introduced. Main tool is a completeness relation written in different forms: in terms of the density matrices of spin states and in other relative forms. The corresponding quantum analogs of the Bell inequality are obtained. 18 refs.; 2 tabs.

1803 (JINR-E–2-91-477) **Classical mechanics of confined particles.** Kapuscik, E.; Horzela, A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 10p. Order Number DE93606037. Source: OSTI; NTIS (US Sales Only); INIS.

An alternative picture of classical many body mechanics is proposed. The theory is complete and allows to determine the trajectories of each particle. 4 refs.

1804 (JINR-E–5-91-385) **Quantum states of the photon phase operator.** Popov, V.N. (AN SSSR, Leningrad (Russian Federation). Matematicheskij Inst.); Yarunin, V.S. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 6p. Order Number DE93606038. Source: OSTI; NTIS (US Sales Only); INIS.

A short review is given for two different photon phase states in quantum optics, introduced by Popov, Yarunin (1973) and Barnet, Pegg (1989). The difference between them is analyzed and the second construction (1989) is shown to be a private case of the first one. 8 refs.

1805 (JINR-E–5-91-485) **On the impossibility of creating the quantum correlations with computer.** Vinduska, M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of

Nuclear Reactions. 1991. 15p. Order Number DE93606039. Source: OSTI; NTIS (US Sales Only); INIS.

It is indicated that Feynman's proof about the impossibility of creating the quantum correlations with computers does not hold if the general transformations of the probability measure of the treated systems do not for a group. In the paper the consequences of this fact are considered in relation to the Bell inequalities and to the models of relative probability measure on the concave surfaces. 5 refs.; 4 figs.; 2 tabs.

1806 (JINR-R–2-91-403) **On the method of determining relations.** Mel'nikov, V.K. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 8p. (In Russian). Order Number DE93606041. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the 7-th conference on nonlinear evolution equations and dynamic systems, Italy, June, 1991.

It is shown that a multicomponent nonlinear Schroedinger equation with a source can be derived by the method of determining relations thus making it possible to apply the inverse scattering method to analyze this equation. However, the system of evolution equations for the scattering data turned out to be nonlinear. An operator relation of the Lax type is also derived which holds due to this equation. However, this operator relation does not uniquely determine this equation and does not guarantee independence of time of the discrete spectrum of the corresponding linear operator. 7 refs.

1807 (JINR-R–2-91-460) **Equation of motion of four degree for tetranions.** Yamaleev, R.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. 14p. (In Russian). Order Number DE93606042. Source: OSTI; NTIS (US Sales Only); INIS.

The generalization of the Dirac equation for the case of four degree polynomial relashioship between energy and momentum is suggested. By the way of change the complex wave function with the wave function on multicomplex numbers of four degree provides the unique form of polynomials. The particles with similar properties are called tetranions. 6 refs.

1808 (JINR-R–4-91-440) **Elements of the theory of resonance management of the quantum scattering: Simple models clarifying the general case.** Zakhar'ev, B.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 19p. (In Russian). Order Number DE93606043. Source: OSTI; NTIS (US Sales Only); INIS.

The present paper continues a set of papers on quantum engineering. It is shown on the model examples that the structure of the target provides the growth of the phase shift by several π. The models with potential barriers concentrated at a separate points and one- and multi-channel targets are considered. 12 refs.; 11 figs.

1809 (JINR-R–4-91-453) **A new view on the machinery of generation of spectral zones: The discrete and the ordinary quantum mechanics.** Zastavenko, L.G.; Zakhar'ev, B.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 18p. (In Russian). Order Number DE93606044. Source: OSTI; NTIS (US Sales Only); INIS.

The instructive comparison of the creation of allowed and forbidden zones by the simplest models with periodical delta-type potentials and with the free wave motion along the descrete variable is presented. It is shown how to connect spectral parameters of the infinitely deep potential well of the finite widths with the properties of the motion in the periodical potentials. 24 refs.; 5 figs.

1810 (JINR-R–17-91-446) **Quantum-kinetic Green function and macroscopic wave function.** Lushchikov, V.I.; Savel'eva, A.E. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 16p. (In Russian). Order Number DE93606040. Source: OSTI; NTIS (US Sales Only); INIS.

On the basis of Schroedinger equation, generalized to six-dimensional phase space and brought into correspondence with the hypothesis of the particle interaction with vacuum, the equations for quantum-kinetic Green function and macroscopic wave function are proposed. The quantum-kinetic Green function is found, which takes into account both the motion properties of a separate particle and the collective characteristics of the system. 4 refs.

1811 (WIS-PH–92-45) **Regular and chaotic motion of two dimensional electrons in a strong magnetic field.** Bar-Lev, Oded; Levit, Shimon. Weizmann Inst. of Science, Rehovoth (Israel). May 1992. 14p. Order Number DE93604091. Source: OSTI; NTIS (US Sales Only); INIS.

For two dimensional system of electrons in a strong magnetic field a standard approximation is the projection on a single Landau level. The resulting Hamiltonian is commonly treated semiclassically. An important element in applying the semiclassical approximation is the integrability of the corresponding classical system. We discuss the relevant integrability conditions and give a simple example of non-integrable system-two interacting electrons in the presence of two impurities-which exhibits a coexistence of regular and chaotic classical motions. Since the inverse of the magnetic field plays the role of the Planck constant in these problems, one has the opportunity to control the 'closeness' of chaotic physical systems to the classical limit. (author).

1812 (ANL/CP–76580) **Radioactive target and source development at Argonne National Laboratory.** Greene, J.P.; Ahmad, I.; Thomas, G.E. Argonne National Lab., IL (United States). [1992]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920933–3: 16. world conference of the International Nuclear Target Development Society: nuclear target preparation, Legnaro (Italy), 21-25 Sep 1992). Order Number DE93000614. Source: OSTI; NTIS; INIS; GPO Dep.

An increased demand for low-level radioactive targets has created the need for a laboratory dedicated to the production of these foils. A description is given of the radioactive target produced as well as source development work being performed at the Physics Division target facility of Argonne National Laboratory (ANL). Highlights include equipment used and the techniques employed. In addition, some examples of recent source preparation are given as well as work currently in progress.

1813 (CEA-CONF–11032) **Closed cycle liquid helium refrigerators.** Claudet, G.; Lagnier, R.; Ravex, A. CEA Centre d'Etudes de Grenoble, 38 (France). Dept. de Recherche Fondamentale sur la Matiere Condensee. 1992. 4p. (CONF-9206300–: International Conference on Institute of Refrigeration, Kiev (USSR), 8-12 Jun 1992). Order Number DE93721141. Source: OSTI; NTIS (US Sales Only); INIS.

We have developed closed cycle liquid helium refrigerators using a Joule Thomson circuit precooled by commercially available two staged Gifford Mac Mahon cryocoolers. The Joule Thomson counterflow heat exchangers are modular and have been thermohydraulically characterized. Fully automatic cool down and operation are achieved by two pneumatically driven by pass and expansion valves. Several apparatus have been built or are under assembly with cooling power ranging from 100 mW up to 5 Watt, for temperature ranging from 2.8 K up to 4.5 K. A trouble free operation with several warm up and cool down cycles has been proven over 7000 hours.

1816 (IPNO-DRE–91-30) **New projectiles: multicharged metal clusters and biopolymers.** Della-Negra, S.; Gardes, D.; Le Beyec, Y.; Waast, B. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1991. 19p. (In French). Order Number DE93721030. Source: OSTI; NTIS (US Sales Only); INIS.

Metal clusters and molecules are the one mean to realize simultaneous impacts of several atoms on a reduced surface(≈100A). The interaction characteristics is the non-linearity of energy deposition; the perturbation that the cluster produces, is above than the sum of the perturbation induced by its components, taken separately. The purpose of ORION project is to accelerate these new projectiles at ORSAY Tandem. The considered mass range is from 100 Daltons to 100 000 Daltons and energy range from MeV to GeV.

We have investigated a variety of research topics on the interface of nuclear physics and astrophysics during the past year. We have continued our study of dihyperon states in dense matter and have started to make a connection between their properties in the core of neutron stars with the ongoing experimental searches at Brookhaven National Laboratory. We started to build a scenario for the origin of gamma-ray bursts using the conversion of neutron stars to strange stars close to an active galactic nucleous. We have been reconsidering the constraints due to neutron star cooling rates on the equation of state for high density matter in the light, of recent findings which show that the faster direct Urca cooling process is possible for a range of nuclear compositions. We have developed a model for the formation of primordial magnetic fields due to the dynamics of the quark-hadron phase transition. Encouraged by the most recent observational developments, we have investigated the possible origin of the boron and beryllium abundances. We have greatly improved the calculations of the primordial abundances of these elements I>y augmenting the reaction networks and by updating the most recent experimental nuclear reaction rates. Our calculations have shown that the primordial abundances are much higher than previously thought but that the observed abundances cannot be explained by primordial sources alone. We have also studied the origin of the boron and beryllium abundances due to cosmic ray spallation. Finally, we have continued to address the solar neutrino problem by investigating the impact of astrophysical uncertainties on the MSW solution for a full three-family treatment of MSW mixing.

1818 (DOE/ER/40682–18) **Non-Abelian soft boson phase transitions and large scale structure.** Holman, R. (Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Physics); Singh, A. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Physics. 20 Apr 1992. 10p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract FG02-91ER40682;AC02-76ER03066. Grant PHY89-04035. (CMU-HEP–92-06;NSF-ITP–92-19). Order Number DE93002649. Source: OSTI; NTIS; INIS; GPO Dep.

A new class of models with Pseudo-Nambu-Goldstone bosons (PNGB's) is constructed using a non-Abelian symmetry in the right handed Majorana neutrino sector of see-saw neutrino mass models. The phase structure of these models is examined both at zero and non-zero temperatures, with particular emphasis on their phase transition characteristics. We find that the vacuum manifold of these models exhibits a rich structure in terms of possible topological defects, and we argue that these models may have applications to late time phase transition theories of structure formation.

1819 (IC–92/174) **Chirality, phase transitions and their induction in amino acids.** Salam, A. International Centre for Theoretical Physics, Trieste (Italy). Apr 1991. 13p. Order Number DE93604117. Source: OSTI; NTIS (US Sales Only); INIS.

"Atoms such as carbon, oxygen, nitrogen and hydrogen, the major constituents of biological molecules, are less than 0.4 nm in diameter... The behaviour of small molecules is a reflection of the intrinsic properties of the constituent atoms. Hence it might be expected that the behaviour of large macromolecules can be explained by a knowledge of atomic properties. Since organelles, whole cells and organisms are essentially macromolecular assemblies, it may be possible in time to derive an atomic theory of life" (Rees and Sternberg). It has been suggested that chirality among the twenty amino acids which make up the proteins may be a consequence of a phase transition which is analogous to that due to BCS superconductivity. We explore these ideas in this paper and show, following Lee and Drell, that a crucial form for the transition temperature T_c involves dynamical symmetry breaking. The t-quarks or supersymmetry (or something similar which ensures a heavy mass) appear to be essential if such mechanisms are to hold. (author). 12 refs, 1 fig., 1 tab.

The study on phenomena in the super high energy region, $\Sigma E_i > 1000$ TeV revealed events that present a big dark spot in central region with high concentration of energy and particles, called halo. Six super families with halo were analysed by Brazil-Japan Cooperation of Cosmic Rays. For each family the lateral distribution of energy density was constructed and R_c Σ E ($R < R_c$) was estimated. For studying primary composition, the energy correlation with particles released separately in hadrons and gamma rays was analysed. (M.C.K.).

1826 (INIS-BR--2934, pp. 323-326) **OMEGA project.** Shibuya, E.H. (Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica). Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489--: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

The OMEGA - Observation of Multiple particle production, Exotic Interactions and Gamma-ray Air Shower-project is presented. The project try to associate photosensitive detectors from experiences of hadronic interactions with electronic detectors used by experiences that investigate extensive atmospheric showers. (M.C.K.).

1827 (INIS-BR--2934, pp. 327-330) **Correlation between transverse momentum and multiplicity of C-jets.** Shibuya, E.H. (Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica). Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489--: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

Studies on hadronic interactions at high energies done by Brazil-Japan Cooperation of cosmic rays are presented. The chamber of photo emulsions-lead used as detector is described. The correlation between transverse momentum and multiplicity is obtained and compared with results obtained from particle accelerators. (M.C.K.).

1830 (IYaF--91-62) **Complex apparatus and results of active experiment Electron-1 with injection of electronic beam in the ionosphere.** Bykovskij, V.F. (and others); Goryachev, S.B.; Doroshkin, A.A. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 45p. (In Russian). Order Number DE93605452. Source: OSTI; NTIS (US Sales Only); INIS.

The 'Electron' scientific apparatus complex designed for active experiments with electron beam injection from space vehicles board is described. The complex comprises electron injector with high-frequency modulator, a set of board diagnostic equipment and three ejection diagnostic containers. Results of an experiment on the modulated electron beam interaction (0.5A current and 6.5-8 keV energy) with ionospheric plasma at 90-150 km altitudes are presented. Energy spectra of recurrent electrons and ions arriving at a meteorocket are presented. 20 refs.; 25 figs.; 2 tabs.

1831 (LA-UR--92-2946) **Element diffusion in pulsating variables.** Guzik, J.A. Los Alamos National Lab., NM (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9207156--1: International Astronomical Union (IAU) colloquium 139 on new perspectives on stellar pulsation and pulsating variable stars, Victoria (Canada), 7-11 Jul 1992). Order Number DE93000795. Source: OSTI; NTIS; GPO Dep.

Can pulsation studies yield information on the operation of element diffusion in stars? Can diffusion explain unusual properties of pulsating variables? Element diffusion theory and recent research relevant to these questions will be reviewed, with emphasis on the Sun and δ Scuti stars. High-degree solar p-modes that are sensitive to helium ionization support a reduced convection zone helium abundance consistent with that expected from diffusion. Intermediate-degree p-modes can be used to probe the structure of the convection zone base and constrain possible diffusion-produced composition gradients. δ Scuti variables have shallow convection zones and relatively short diffusion timescales. Helium diffusion may explain unusual period ratios, influence period changes, and affect the amplitudes and light curve shapes of δ Scuti stars.

DOE Contract AC03-76SF00098. (CONF-9112138--1: 21. Congress of science et tradition: perspectives transdiciplinaries, ouvertures vers eme siecle at l'U.N.E.S.C.O., Paris (France), 2-6 Dec 1991). Order Number DE92041186. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses whether the events that occur in the universe evolve deterministicly or randomly or both. (LSP).

1833 (LBL--32562) **Interpretation of rapidly rotating pulsars.** Weber, F. (Technische Univ. Muenchen, Garching (Germany). Inst. fuer Theoretische Physik); Glendenning, N.K.

Lawrence Berkeley Lab., CA (United States). 5 Aug 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9207113–3: 2. international symposium on nuclear astrophysics: nuclei in the cosmos, Karlsruhe (Germany), 6-10 Jul 1992). Order Number DE93000576. Source: OSTI; NTIS; INIS; GPO Dep.

The minimum possible rotational period of pulsars, which are interpreted as rotating neutron stars, is determined by applying a representative collection of realistic nuclear equations of state. It is found that none of the selected equations of state allows for neutron star rotation at periods below 0.8–0.9 ms. Thus, this work strongly supports the suggestion that if pulsars with shorter rotational periods were found, these are likely to be strange-quark-matter stars. The conclusion that the confined hadronic phase of nucleons and nuclei is only metastable would then be almost inescapable, and the plausible ground-state in that event is the deconfined phase of (3-flavor) strange-quark-matter.

1834 (LBL–32634) **Measuring q_0 using supernovae at $z \approx 0.3$.** Newberg, H.J.M. Lawrence Berkeley Lab., CA (United States). Jul 1992. 112p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Contract AST8809616. Order Number DE92041164. Source: OSTI; NTIS; INIS; GPO Dep.

The measurement of q_0 is extremely important for understanding the quantity of matter in our universe. The measurement of q_0 using supernovae of type Ia as standard candles is appealing because it requires less modeling than other methods using galaxies. The challenge with using supernovae to measure q_0 is in finding enough of them. In order to find supernovas, we have constructed a very popular f/1 camera for the 3.9m Anglo-Australian Telescope. The camera uses reducing optics that put a 17 in. x 17 in. field on a 1024 x 1024 pixel Thomson CCD. Using this system, we image to 23rd magnitude in five minutes. We have developed a software package that uses image subtraction to find supernovae that are approximately magnitude 22.4 or brighter in these images. One field can be processed every 6.6 minutes on a relatively unloaded VAX 6000-6510. We estimate that this system should find one supernova in every 105–139 images (about two nights of observation on the AAT). Throughout the two years of operation, we observed the equivalent of about four nights with seeing better than two arc seconds. Although we found many candidates, we were unable to confirm any supernovae. The next generation of this search is currently using the 2.5m Isaac Newton Telescope in the Canary Islands. We have solved many problems encountered with the AAT search by targeting distant clusters of galaxies, by operating at a site that allows higher resolution imaging, and by scheduling follow-up observations. This system, although still in its infancy, has yielded one event that could be a high redshift supernova. We estimate that it will require 36 type Ia supernovae, discovered at or before maximum, to find q_0 to within 0.2, and 144 such supernovae to measure q_0 within 0.1. Clearly, the program will have to be expanded to find this quantity of supernovae.

DAPNIA, department of Astrophysics, Particle Physics, Nuclear Physics and Associated Instrumentation is a new CEA department, created in July 1991. This report makes the synthesis and gives the prospects of department activities. In Nuclear Physics, 3 topics are studied: nuclear structure with DAPNIA superconducting post-accelerated tandem and GANIL cyclotron, thermodynamics properties with GANIL cyclotron and LNS, and hadronic systems with SPS and SLAC. In Particle Physics, DAPNIA participates in experimental program that has been decided to establish the validity of Standard Model near to electron-positron colliders of LEP. Cryo magnetism and superconducting cavity laboratories contribute to DAPNIA programs and participate in outer programs.

This is a progress report on the first year of the five year proposal of the UCSD high energy physics group. The main activity of our group continues to be the L3 experiment at LEP. During the last year in L3, we have worked principally on physics analysis. We have also fulfilled our duties in running the detector and contributing to L3 software and computing. In addition, we have made a major effort toward the development of the GEM detector at the SSC. Our SSC work is done in collaboration with the other UCSD groups which are primarily supported by the NSF. In this progress report, we will review our recent activities and describe the current status of the group. Some of the publications and documents which display the work of our group over the last year are included as appendices. We will also outline our research plan to continue our participation in L3 physics and upgrades and to work on the design and construction of the GEM detector.

During this reporting period the group has been carrying out programs in several areas. These are presented in this paper is follows: The group was a collaborator in the Mark II experiment at the SLC and completed analysis on the experiment. Three students completed their theses this reporting period; the group is the prime mover in (E672), a high mass dimuon experiment which now in its final data collection period. Our group is also a collaborator in the DO collider experiment which is now preparing for the first data run in 1992; the group is a collaborator in the OPAL experiment at LEP which is now taking data. The group also is working on the development of a major offline facility shift and on a silicon vertex chamber for 1993; the group is the prime mover in the construction of a major new experiment (E852) in precision meson spectroscopy. A test run is presently underway and data taking will begin in 1993; and the group is a prime mover in the tracking design of the SDC experiment. The SDC has completed the Technical Design report. Construction will begin in 1993.

During the last two years, physics experiments at LAL have focused towards new lines: end of fixed target experiments, continuity of underground physics, high activity of physics in collisions, opening towards astrophysics. Two experiments have reached their final analysis phase: NA31 for the study of CP violation and rare decays in K neutral's, UA2' for pantip collisions. Since the first e^+e^- collisions in August 1989, LEP experiments, Aleph and Delphi, have produced a huge amount of results on Z neutral physics and searches for new phenomena. After several years of design, construction and installation, the H1 detector is now waiting for the first ep collisions at HERA. Feasibility experiments as NEMO and Themistocle have reached a first step in proving the possibility of observing double beta decays for the former, point sources of cosmic gammas of very high energy for the latter. Two astrophysics experiments are at preliminary or design levels: the Naines Brunes (Brown Dwarfs) searches for compact massive objects contributing to Dark Matter while the very challenging experiment Virgo aims at the first evidence for gravitational waves. Future experiments, in particular at LHC, are being prepared by R and D in detectors.

A few general features of microscopics evolution and their relationship with microscopics methodology are briefly surveyed. Several pluri-disciplinary and interdisciplinary aspects of microscopics research are also discussed in the present scientific context. The need for an equilibrium between individual tendencies and collective constraints required by team work, already formulated thirty years ago by Frederic Joliot, is particularly stressed in the present conjuncture of Nuclear Research favouring very large team projects and discouraging individual initiatives. The increasing importance of the science of science (due to their multiple social, economical, ecological aspects) and the stronger competition between national and international tendencies of scientific (and technical) cooperation are also discussed. (author).

The statistics-altering operators η present in the limit q = -1 of multiparticle $SU_q(2)$- invariant subspaces parallel the action of such operators which naturally occur in supersymmetric theories. I illustrate this heuristically by comparison to a toy N = 2 superymmetry algebra, and ask whether there is a supersymmetry structure underlying $SU_q(2)$ in that limit. I remark on the relevance of such alternating-symmetry multiplets to the construction of invariant hamiltonians.

1843 (DOE/ER/40153–9) **Research in particle theory: Annual progress report, November 1, 1991–October 10, 1992.** Mansouri, F.; Suranyi, P.; Wijewardhana, L.C.R. Cincinnati Univ., OH (United States). Dynamics of 2+1 dimensional gravity is analyzed by coupling matter to Chern Simons Witten action in two ways and obtaining the exact gravity Hamiltonian for each case. 't Hoot's Hamiltonian is obtained as an approximation. The notion of space-time emerges in the very end as a broken phase of the gauge theory. We have studied the patterns of discrete and continuous symmetry breaking in 2+1 dimensional field theories. We formulate our analysis in terms of effective composite scalar field theories. Point-like sources in the Chern-Simons theory of gravity in 2+1 dimensions are described by their Poincare' charges. We have obtained exact solutions of the constraints of Chern-Simons theory with an arbitrary number of isolated point sources in relative motion. We then showed how the space-time metric is constructed. A reorganized perturbation expansion with a propagator of soft infrared behavior has been used to study the critical behavior of the mass gap. The condition of relativistic covariance fixes the form of the soft propagator. Approximants to the correlation critical exponent were obtained in two loop order for the two and three dimensional theories. We proposed a new model of QED exhibiting two phases and a Majorana mass spectrum of single particle states. The model has a new source of coupling constant renormalization which opposes screening and suggests the model may confine. Assuming that the bound states of e^+e^- essentially obey a Majorana spectrum, we obtained a consistent fit of the GSI peaks as well as predicting new peaks and their spin assignments.

1844 (DOE/ER/40561–76) **The SU(3)-Nambu-Jona-Lasinio soliton in the collective quantization formulation.** Blotz, A. (Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory); Goeke, K.; Diakonov, D.; Petrov, V.; Pobylitsa, P.V.; Park, N.W. Washington Univ., Seattle, WA (United States). Dept. of Physics. 11 Jun 1992. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER40561. Order Number DE92040075. Source: OSTI; NTIS; INIS; GPO Dep.

On grounds of a semibosonized Nambu-Jona-Lasinio model, which has $SU(3)_R \otimes SU(3)_L$-symmetry in the chiral limit, mass splittings for spin 1/2 and spin 3/2 baryons are studied in the presence of an explicit chiral symmetry breaking strange quark mass. To this aim these strangeness carrying baryons are understood as SU(3)-rotational excitations of an SU(2)-embedded soliton solution. Therefore, within the framework of collective quantization, the fermion determinant with the strange quark mass is expanded up to the second order in the flavor rotation velocity and up to the first order in this quark mass. Besides the strange and non-strange moments of inertia, which have some counterparts within the Skyrme model, some so-called anomalous moments of inertia are obtained. These call be related to the imaginary part of the effective Euclidian action and contain among others the anomalous baryon current. This is shown in a gradient expansion up to the first non-vanishing order. Together with the Σ-commutator these are the solitonic ingredients of the collective hamiltonian, which is then diagonalized by means of strict perturbation theory in the strange quark mass and by the Yabu-Ando method. Both methods yield very good results for the masses of the spin 1/2 and 3/2 baryons. The former one reproduces some interesting mass formulas of Gell-Mann Okubo and Guadagnini and the latter one is able to describe the mass splittings up to a few MeV.

1845 (DOE/ER/40617–134) **Research in elementary particle physics: Progress report, March 1, 1992–February 28, 1993.** Chan, Lai-Him; Haymaker, R.; Imlay, R.; McNeil, R.; Metcalf, W.; Svoboda, R. Louisiana State Univ., Baton Rouge, LA (United States). [1992]. 115p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER40617. Order Number DE93001858. Source: OSTI; NTIS; INIS; GPO Dep.

We describe theoretical work on effective action expansion on an effective low energy theory of hadrons and lattice gauge theories. The high energy experimental group at Louisiana State University has analyzed data on a neutrino oscillation experiment at LAMPF. The LSND neutrino experiment is preparing to take data in 1993. IMB data has been analyzed. Preparations for a beam test at KEK for IMB are in progress. Dumand is preparing to test one string of the detector early next summer. The ZEUS electron proton colliding beam experiment has started to take data. Early results have been reported.

1846 (DOE/ER/40682–2) **Maximal CP violation via Higgs-boson exchange.** Lavoura, L. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Physics. 6 Mar 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40682. (CMU-HEP–92-07). Order Number DE93002417. Source: OSTI; NTIS; INIS; GPO Dep.

The unitarity of the mixing matrix of the charged Higgs bosons, and the orthogonality of the mixing matrix of the neutral Higgs bosons, are used to derive upper bounds on the values of general CP-violating expressions. The bounds are independent of the total number of Higgs fields in any specific model. They allow is to relax the usual assumption of only one Higgs boson being light. It is natural that the CP violation in the exchange of neutral Higgs bosons between bottom quarks be particularly large.

1847 (DOE/ER/40682–4) **Comment on "Flavor-changing processes and CP violation in the $S_3 \times Z_3$ model".** Lavoura, L. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Physics. 28 Apr 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40682. (CMU-HEP–92-09). Order Number DE93002415. Source: OSTI; NTIS; INIS; GPO Dep.

Deshpande, Gupta and Pal neglected the presence of a complex phase in the mass matrix and in the Yukawa coupling matrices of the down-type quarks I argue that phase should not be neglected, because it can explain the observed CP violation. The mechanism of CP violation considered by those authors may certainly be present, but for simplicity one may want to eliminate it, by restricting the soft-breaking sector of the Higgs potential in such a way that complex Higgs bosons propagators do not occur.

1848 (DOE/ER/40682–11) **Generalized semilocal theories and higher Hopf maps.** Hindmarsh, M. (California Univ., Santa Barbara, CA (United States). Inst. for Theoretical Physics); Holman, R. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Physics. Jun 1992. 15p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract FG02-91ER40682 ;FG05-85ER40226. Grant PHY89-04035. (NSF-ITP–92-93;CMU-HEP–92-16). Order Number DE93002644. Source: OSTI; NTIS; INIS; GPO Dep.

In semilocal theories, the vacuum manifold is fibered in a non-trivial way by the action of the gauge group. Here we generalize the original semilocal theory (which was based on the Hopf bundle $S^3 \rightarrow^{S1} S^2$) to realize the next Hopf bundle $S^7 \rightarrow^{S3} S^1$, and its extensions $S^{2n+1} \text{yields} S^3$ HP^n. The semilocal defects in this class of theories are classified by $\pi_3(S^3)$, and are interpreted as constrained instantons or generalized sphaleron configurations. We fail to find a field theoretic realization of the final Hopf bundle $S^{15} \rightarrow^{S7} S^8$, but are able to construct other semilocal spaces realizing Stiefel bundles over Grassmanian spaces.

1849 (DOE/ER/40682–12) **Superweak-like models of CP violation.** Lavoura, L. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Physics. 19 Jun 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40682. (CMU-HEP–92-17). Order Number DE93002645. Source: OSTI; NTIS; INIS; GPO Dep.

I put forward a two-Higgs-doublet model in which CP violation is mediated only by the neutral Higgs bosons, via the mechanism of scalar-pseudoscalar mixing. In this model there is no CP violation in the exchange of either W bosons or of charged Higgs bosons. The model is therefore an approximate realization of the superweak theory of CP violation. It has only two basic CP-violating quantities. I point out that other models of this kind, but with more than two Higgs doublets, may also be built.

1850 (IC–92/108) **Spherically symmetric line element and Killing vectors in five-dimensional space.** Rcheulishvili, G. International Centre for Theoretical Physics, Trieste (Italy). Jun 1992. 9p. Order Number DE93604132. Source: OSTI; NTIS (US Sales Only); INIS.

The series of Killing vectors for the line element are described. Their algebras and curvature are presented. The explicit expressions of metrics for higher symmetries are written down. (author). 7 refs.

1851 (IC–92/117) **Lie bialgebras with triangular decomposition.** Andruskiewitsch, N. (Max-Planck-Inst. fuer Mathematik, Bonn (Germany)); Levstein, F. International Centre for Theoretical Physics, Trieste (Italy). Jun 1992. 20p. Order Number DE93604232. Source: OSTI; NTIS (US Sales Only); INIS.

Lie bialgebras originated in a triangular decomposition of the underlying Lie algebra are discussed. The explicit formulas for the quantization of the Heisenberg Lie algebra and some motion Lie algebras are given, as well as the algebra of rational functions on the quantum Heisenberg group and the formula for the universal R-matrix. (author). 17 refs.

1852 (IC–92/146) **Superconformal structures and holomorphic 1/2-superdifferentials on N=1 super Riemann surfaces.** Kachkachi, H.; Kachkachi, M. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 15p. Order Number DE93604133. Source: OSTI; NTIS (US Sales Only); INIS.

Using the Super Riemann-Roch theorem we give a local expression for a holomorphic 1/2-superdifferential in a superconformal structure parametrized by special isothermal coordinates on an N=1 Super Riemann Surface (SRS). This construction is done by choosing a suitable origin for these coordinates. The holomorphy of the latter with respect to super Beltrami differentials is proven. (author). 26 refs.

1853 (IC–92/154) **Normal forms of invariant vector fields under a finite group action.** Sanchez Bringas, F. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 8p. Order Number DE93604134. Source: OSTI; NTIS (US Sales Only); INIS.

Let Γ be a finite subgroup of GL(n,C). This subgroup acts on the space of germs of holomorphic vector fields vanishing at the origin in C^n. We prove a theorem of invariant conjugation to a normal form and linearization for the subspace of invariant elements and we give a description of these normal forms in dimension n=2. (author).

1854 (IC–92/171) **Electric magnetic duality in string theory.** Sen, A. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 16p. (TIFR-TH–92-41.). Order Number DE93606061. Source: OSTI; NTIS (US Sales Only); INIS.

The electric-magnetic duality transformation in four dimensional heterotic string theory discussed by Shapere, Trivedi and Wilczek is shown to be an exact symmetry of the equations of motion of low energy effective field theory even after including the scalar and the vector fields, arising due to compactification, in the effective field theory. Using this duality transformation we construct rotating black hole solutions in the effective field theory carrying both electric and magnetic charges. The spectrum of extremal magnetically charged black holes turn out to be similar to that of electrically charged elementary string excitations lying on the leading Regge trajectory. We also discuss the possibility that the duality symmetry is an exact symmetry of the full string theory under which electrically charged elementary string excitations get exchanged with magnetically charged soliton like solutions. This proposal might be made concrete following the suggestion of Dabholkar et. al. that fundamental strings may be regarded as soliton like classical solutions in the effective field theory. (author). 20 refs.

1855 (IC–92/173) **Redundancy of the quantum level gauge fixing condition.** Kachkachi, H.; Kachkachi, M. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 7p. Order Number DE93604135. Source: OSTI; NTIS (US Sales Only); INIS.

We regard the manifold Γ-circumflex defined by the equations of motion (EM) of the gauge and ghost fields w.r.t. the gauge-fixed action as a fiber bundle over the manifold Γ defined by the EM of the gauge fields only w.r.t. the classical action. Accordingly, the BRST operator is interpreted as the nilpotent exterior derivative on Γ; the ghost field appears as the differential 1-form. This fiber bundle setup allows us to prove that any gauge condition on Γ-circumflex is equivalent to another one on the base manifold Γ and does not break the BRST symmetry of the quantized theory. (author). 11 refs.

1856 (IC–92/179) **Solitons and bubbles in models with Chern-Simons term.** Masperi, L. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 11p. Order Number DE93606062. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that a gauge theory for complex scalar field with up to sextic self-interactions and a Chern-Simons term in 2 + 1 dimensions has solitons which may become bubbles of the stable broken-symmetry phase in a medium of the symmetric one producing the first-order phase transition. In the non-relativistic limit scale invariance prevents the determination of an optimal bubble size. Possible extensions to 3 + 1 dimensions of bubbles of string type are indicated. (author). 8 refs.

1857 (IC–92/180) **Superfield wave function for N=4, d=4 superparticle.** Ilieva, N. (International Centre for Theoretical Physics, Trieste (Italy)); Litov, L. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 10p. Order Number DE93604136. Source: OSTI; NTIS (US Sales Only); INIS.

A canonical generalized-supertwistor formulation of the superparticle action is given, which provides a natural construction of the quantum superparticle wave function in unconstrained superfield terms. The superspace is considered as a space of parameters of the supercoherent states defining the basis for oscillator-like UIR's of the superconformal group SU(2,2/N) the basis being fixed uniquely by satisfying the spin-shell constraint. A possible superstring action is proposed in analogy with the superparticle one. (author). 12 refs.

1858 (IC–92/184) **The ground state wavefunctions of a conformally invariant scalar field in different spacetime background.** Anini, Y. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 17p. Order Number DE93606063. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper we carefully construct the ground state wavefunction of a conformally invariant scalar field as an Euclidean path integral over real field configurations that vanish at the past end point of Euclidean time. We consider two Euclidean spacetime backgrounds. The compact without boundary, i.e., a 4-sphere, and the asymptotically flat, i.e., a wormhole spacetime. Finally, we show that the analytic continuation of these states to the corresponding Lorentzian spacetime satisfy the time-dependent Schroedinger equation with proper choice of the pre-factor for the wavefunction. (author). 5 refs, 2 figs.

1859 (IC–92/187) **Positive energy representations of the conformal quantum algebra.** Dabrowski, L. (International School of Advanced Studies, Trieste (Italy)); Dobrev, V.K.; Husain, V.; Floreanini, R. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 13p. (SISSA–137/92/FM;UTS-DFT–22-92.). Order Number DE93606064. Source: OSTI; NTIS (US Sales Only); INIS.

The positive-energy unitary irreducible representations of the q-deformed conformal algebra $\delta C_q = U_q(su(2,2))$ are obtained by appropriate deformation of the classical ones. When the deformation parameter q is N -th root of unity, all these unitary representations become finite-dimensional. For his case we discuss in some detail the massless representations, which are also irreducible representations of the q-deformed Poincare subalgebra of δC_q. Generically, their dimensions are smaller than the corresponding finite-dimensional non-unitary representation of su(2,2), except when N = 2 modul h + 1, where h is the helicity of the representations. The latter cases include the fundamental representations with $h = \pm 1/2$. (author). 10 refs.

1860 (IC–92/190) **Connections between quantized affine algebras and superalgebras.** Zhang, R.B. International Centre for Theoretical Physics, Trieste (Italy). Aug 1992. 12p. Order Number DE93606065. Source: OSTI; NTIS (US Sales Only); INIS.

Every affine superalgebra with a symmetrizable Cartan matrix is closely related to an ordinary affine algebra with the same Cartan matrix. It is shown that the quantum supergroup associated with the former is essentially isomorphic to the quantum group associated with the latter in an appropriate class of representations. At the classical level, each integrable irreducible highest weight representation of the affine superalgebra has a corresponding irreducible representation of the affine algebra, which has the same weight space decomposition. (author). 5 refs, 3 tabs.

1861 (IC–92/195) **On a permutation character of the group $GL_n(q)$.** Darafsheh, M.R. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 5p. Order Number DE93606066. Source: OSTI; NTIS (US Sales Only); INIS.

A theorem concerning the permutation character of the linear group $GL_n(q)$ on $Vn(q)^*$ where Vn(q) is a vector space is demonstrated. 3 refs.

1862 (INIS-BR–2934, pp. 16-30) **Quantum gravity.** Lyra, J.G. de (Sao Paulo Univ., SP (Brazil). Inst. de Fisica). Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

The gravity quantization is discussed; and an explanation on quantum field theory is presented. (M.C.K.).

1863 (INIS-BR–2934, pp. 31-72) **Conformal field theories and representation of Virasoro and Kac-Moody algebra.** Ferreira, L.A. (Instituto de Fisica Teorica (IFT), Sao Paulo, SP (Brazil)). Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

An introduction to study Virasoro and Kac-Moody algebra in quantum field theory with two-dimension conformal invariance using free fermions as example is presented. (M.C.K.).

1864 (INIS-BR–2934, pp. 91-115) **Fractionary statistics and field theories in (2+1) dimensions.** Gomes, M. (Sao Paulo Univ., SP (Brazil). Inst. de Fisica). Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

The existence of fractionary angular momentum and the exotic statistics in many dimensions are analysed. The soliton type excitations of non linear sigma model with 0(3) symmetry are considered. The parity breaking through mass term and the generation of Chern Simon term are discussed in three dimensional fermion model. It is shown that the symmetry breaking can be due to vacuum and this possibility is illustrated in the context of Gross-Never similar model. (M.C.K.).

1865 (INIS-BR–2934, pp. 116-124) **Gauss-Bonnet actions and their dimensionally reduced descendants.** Mueller-Hoissen, F. (Goettingen Univ. (Germany). Inst. fuer Theoretische Physik). Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

A brief introduction to Gauss-Bonnet type generalizations of the Einstein-Hilbert gravity action in more than four dimensions is given and the structure of associated (effective) theories obtained by dimensional reduction is discussed. (author).

1866 (INIS-BR–2934, pp. 235-239) **Soliton bubbles and phase transformations.** Masperi, L. (Comision Nacional de Energia Atomica, San Carlos de Bariloche (Argentina). Centro Atomico Bariloche). Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Spanish). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that no topological classical solutions in form of bubbles of a real scalar field theory with Lagrangian of quartet and sextet self interactions in 1+1 dimensions are responsible to discontinue transitions in the quantum problem between phases with degenerated and disordered excited level. (M.C.K.).

1867 (INIS-BR–2934, pp. 271-274) **Consistences for introducing more vector potentials in the same group, by BRST algorithm.** Doria, R. (Universidade Catolica de Petropolis, RJ (Brazil)); Carvalho, F.A.R. de. Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

The BRS formalism for quantum formulation of gauge theory is analysed applying to extended models. The quantum effective Lagrangian of gauge is established, invariant under s and s→ for a system with vector potentials belong to one Abelian group of gauge. The BRS charge associated to the system is calculated. (M.C.K.).

1868 (INIS-BR–2934, pp. 280-285) **Parity-violating anomaly in three-dimensional supergravity.** Mello, E.R.B. de (Paraiba Univ., Joao Pessoa, PB (Brazil). Dept. de Fisica). Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

The parity-violating part of the one-loop order correction of the locally supersymmetric effective action for a massless scalar superfield coupled to a background (not quantised) superdreibein in three dimensions is presented. The lowest-order approximation to the gravitational Chern-Simons term and its fermionic equivalent term are obtained. (author).

1869 (INIS-BR–2934, pp. 286-289) **The Gauss-Bonnet identity in quartic gravitation theories.** Gomes, M. (Sao Paulo Univ., SP (Brazil). Inst. de Fisica). Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

The possible modifications in Gauss-Bonnet relation due to quantum oscillations are studied. The introduction of quantum operator correspondent in the function of two points, in space without singularities is calculated. (M.C.K.).

1870 (INIS-BR–2934, pp. 240-243) **Chiral symmetry breaking in QED_3.** Almeida, L.D. (Instituto de Fisica Teorica (IFT), Sao Paulo, SP (Brazil)); Natale, A.A. Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

The dynamical chiral symmetry breaking in QED_3 with N fermions is studied. The Schwinger-Dyson equation of fermionic propagator has a bifurcation in $N=32/\Pi^2$. The calculation of effective potential for composed operators confirms this result. (M.C.K.).

1871 (INIS-BR–2934, pp. 253-256) **Construction of Green functions on generalized coherent states.** Boschi Filho, H. (UNESP, Guaratingueta, SP (Brazil). Dept. de Fisico-Quimica); Vaidya, A.N. Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

Green functions for arbitrary system with su(1,1) symmetry are constructed from generalized coherent states. The case of double-ring shaped oscillator is solved. (M.C.K.).

1872 (INIS-BR–2934, pp. 257-260) **SL(2,R) current algebra in two-dimensional conformal quantum gravity.** Abdalla, E. (Sao Paulo Univ., SP (Brazil). Inst. de Fisica); Abdalla, M.C.B.; Zadra, A. Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

The SL(2,R) current algebra in two-dimensional conformal quantum gravity is obtained from its residual symmetries, in the gauge of light cone. (M.C.K.).

1873 (INIS-BR–2934, pp. 261-265) **Jordan algebra and the construction of Kac-Moody algebra.** Ferreira, L.A. (Instituto de Fisica Teorica (IFT), Sao Paulo, SP (Brazil)); Gomes, J.F.; Teotonio Sobrinho, P.; Zimerman, A.H. Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that Jordan algebra presents fundamental structure from which Lie algebra and Kac-Moody algebra can be constructed. (M.C.K.).

1874 (INIS-BR–2934, pp. 266-270) **Supersymmetry and new analytical (exact) solutions of Schroedinger equation.** Drigo Filho, E. (Instituto de Fisica Teorica (IFT), Sao Paulo, SP (Brazil)); Ricotta, R.M. Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

The algebraic aspects of supersymmetric quantum mechanics are applied to calculate some spectral states of a Hamiltonian. (M.C.K.).

1875 (INIS-BR–2934, pp. 275-279) **The most general solutions of Einstein equations.** Souza, M.M. de (Espirito Santo Univ., Vitoria, ES (Brazil). Dept. de Fisica e Quimica). Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that the most general diagonal solutions of Einstein equations are conformally plane using concepts and techniques of simultaneous substitutional symmetries. (M.C.K.).

1876 (INIS-BR–2934, pp. 290-293) **Spontaneous symmetry breaking in O(N)xO(N) model.** Mendes, R.S. (Sao Paulo Univ., SP (Brazil). Inst. de Fisica); Ribeiro, R.F.; Gomes, M.; Silva, A.J. da. Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

The analysis of effective potential of O(N)xO(N) model, in dominant order of 1/N expansion, at zero and finite temperature is presented. (M.C.K.).

1877 (INIS-BR–2934, pp. 313-318) **Rational functions in Skyrme model.** Ferreira, E. (Pontificia Univ. Catolica do Rio de Janeiro, RJ (Brazil). Dept. de Fisica); Galain, R.M.; Ananias Neto, J. Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Portuguese). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

The Rational functions which represent the exact solution for cosine of the hedgehog form chiral angle of Skyrme soliton are constructed. (M.C.K.).

1882 (IYaF-90-119) **Symmetries of generating problems and integrable equations.** Konopel'chenko, B.G. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 10p. Order Number DE93606081. Source: OSTI; NTIS (US Sales Only); INIS.
It is shown that infinite-dimensional Abelian symmetries of generating equations lead to the occurrence of non-linear equations for wave functions and potentials integrated by means of inverse spectral transformation. 13 refs.

1883 (IYaF-91-31) **On the photonic chiral anomaly in an external gravitational field.** Dolgov, A.D.; Kostyuk, S.V.; Khriplovich, I.B. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 12p. Order Number DE93606082. Source: OSTI; NTIS (US Sales Only); INIS.
The anomaly of the photonic chiral current in an external gravitational field parallel by means of the ultraviolet and infrared regularization for spins 1/2 and 1 is discussed. 15 refs.

1884 (JINR-E-2-91-7) **Geometrical approach to the dynamics of a relativistic string in the D-dimensional Minkowski space.** Barbashov, B.M. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics); Shvetz, N.R. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 15p. Order Number DE93606071. Source: OSTI; NTIS (US Sales Only); INIS.
A geometrical method is considered of solving the boundary-value problem in the theory of a relativistic string with point masses at the ends in the D-dimensional pseudo-Euclidean space. The string world surface restricted by two curves, the world trajectories of the point masses, is described in terms of the quadratic differential forms and the torsion vectors. The case D=4 is considered in detail where the equations of the boundaries of the string surface become the Frenet equations. The choice of the constant second and third curvatures of the world trajectories, the latter being equal to zero, determines the world sheet of a relativistic string to be a helicoid, when appropriate transformations of global coordinates are made. The same result has been obtained in a space with D>4, but this requires a further estimate of the torsion vectors at the boundaries. 10 refs.

1885 (JINR-E-2-91-11) **Status of CP violation in K decays within chiral perturbation theory.** Bel'kov, A.A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics); Ebert, D.; Lanev, A.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 18p. Order Number DE93606083. Source: OSTI; NTIS (US Sales Only); INIS.
In the framework of recently derived effective strong and weak meson Lagrangians an analysis of $K \to 2\pi$, $K \to 3\pi$ and $K \to 2\pi\gamma$ decay amplitudes is performed and the current status of direct CP violation in nonleptonic K decays is reviewed. Besides estimates of the charge CP-asymmetry for decay probabilities and slope parameters in charged $K^{\pm} \to 3\pi$ decays, a discussion of the Li-Wolfenstein relation for the direct CP-violation parameter in neutral $K^0(K\text{-bar}^0) \to 3\pi$ decays is given. 30 refs.; 6 figs.

1886 (JINR-E-2-91-316) **Beyond two dimensions.** Tapia, V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 7p. Order Number DE93606084. Source: OSTI; NTIS (US Sales Only); INIS.
It is shown that the critical dimension, for which the symmetry group of a conformal field theory is infinite-dimensional, is equal to the rank of the metric of the base space. It is proved our claim for fourth-rank metrics and show that the critical dimension is four. The symmetry group is Vir+Vir+Vir+Vir. 8 refs.

1887 (JINR-E-2-91-326) **Superfield actions for N=4 WZNW-Liouville systems.** Gorovoj, O.E.; Ivanov, E.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 18p. Order Number DE93606085. Source: OSTI; NTIS (US Sales Only); INIS.
A manifestly supersymmetric formulation of two-dimensional SU(2)xU(1) and SO(4)xU(1)xU(1) N=4 superconformal WZNW sigma models as well as their Liouville extensions via unconstrained N=4 superfluid prepotentials is obtained. Off-shell actions for these systems, both in N=4 2D superspace and ordinary space, and study the invariance properties of the actions under SO(4)xU(1) and SU(2) N=4 superconformal symmetries are constructed. 18 refs.

1888 (JINR-E-2-91-328) **Nonlinear realizations of W_3 symmetry.** Ivanov, E.A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics); Krivonos, S.O.; Pichugin, A.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 15p. Order Number DE93606086. Source: OSTI; NTIS (US Sales Only); INIS.
Submitted to Phys. Lett., B.
We derive the Toda lattice realization of classical W_3 symmetry on two scalar fields in a purely geometric way, proceeding from a nonlinear realization of some associate higher-spin symmetry W_3^{∞} is derived. The Toda lattice equations are interpreted as the constraints singling out a two-dimensional fully geodesic subspace in the initial coset space of W_3^{∞}. This subspace is the quotient of SL(3,R) over its maximal parabolic subgroup. 20 refs.

1889 (JINR-E-2-91-437) **Character of phase transition in two- and three-dimensional scalar $g\phi^4$ theory.** Efimov, G.V.; Ganbold, G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 11p. Order Number DE93606068. Source: OSTI; NTIS (US Sales Only); INIS.
Phase structure of the scalar ϕ^4 theory is considered in two and three dimensions within the method of Effective Potential. This result indicates the absence of second-order phase transitions in these models. 13 refs.

1890 (JINR-E-2-91-445) **Phase structure of three- and four-dimensional ϕ^4 field theory.** Efimov, G.V. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics); Nedel'ko, S.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 28p. Order Number DE93606069. Source: OSTI; NTIS (US Sales Only); INIS.
Strong coupling regime of $g\phi$ theory in space-time R^d for d=3,4 is investigated by the methods of canonical transformations and

renormalization group. Comparison with the case d=2 shows a crucial influence of the renormalization structure of the theory of its phase structure. 19 refs.; 7 figs.; 1 tab.

1891 (JINR-E-2-91-448) **A covariant form of the Maxwell's equations in four-dimensional spaces with an arbitrary signature.** Lukac, I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 22p. Order Number DE93606070. Source: OSTI; NTIS (US Sales Only); INIS.

The concept of duality in the four-dimensional spaces with the arbitrary constant metric is strictly mathematically formulated. A covariant model for covariant and contravariant bivectors in this space based on three four-dimensional vectors is proposed. 14 refs.

1892 (JINR-E-2-91-449) **Application of the unitary representations of the Lorentz group for the description of interaction of a fermion with a scalar particle.** Frik, R.A.; Skachkov, N.B. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 16p. Order Number DE93606087. Source: OSTI; NTIS (US Sales Only); INIS.

Unitary irreducible representations (UIR) of the Lorentz group applied to transform the relativistic three dimensional equations in the momentum space, that describe the interaction of the fermion and the pseudoscalar particle, to the relativistic configurational representation. By help of the addition theorem for the functions, that realize the UIR of the Lorentz group with the nonzero spin, the local potentials in this representation is found. 14 refs.

1893 (JINR-E-5-90-578) **Operator ordering and symbol representations of enveloping algebras.** Lassner, W. (Leipzig Univ. (Germany)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1990. 10p. Order Number DE93606088. Source: OSTI; NTIS (US Sales Only); INIS.

Phase space methods in quantum theory make use of symbol representations of the Weyl algebra. The method can be generalized to enveloping algebras U(L) of Lie algebras L different from the Heisenberg Lie algebra. The method starts from a one-to-one correspondence between the linear space of the enveloping algebra U(L) and that of the symmetric algebra S(L) over L. The algebra S(L) can be equipped with a so-called twisted product so that it becomes isomorphic to U(L). Different ordering rules correspond to different bases in U(L). The elements of U(L) are represented by different symbols in dependence on the ordering rule chosen. We generalize the notion of an ordering defining function ϕ. This helps to determine a transformation between different types of symbols and allows to use the same fast multiplication algorithm for different orderings. 14 refs.

1894 (JINR-E-5-91-402) **Computer algebra tools for higher symmetry analysis of nonlinear evolution equations.** Gerdt, V.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. 10p. Order Number DE93606089. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Working conference on Programming environments for high-level scientific problem solving, 23-27 September, 1991, Karlsruhe, Germany.

Paper presents a computer-aided approach and a software package for symbolic algebraic computation to solve the problem of verifying the existence of the canonical Lie-Backlund symmetries for multicomponent quasilinear evolution equations with polynomial-nonlinearity and computing a given order symmetry. In the presence of arbitrary numerical parameters the problem is reduced to investigation and solving of nonlinear algebraic equations in those parameters. 16 refs.; 2 tabs.

1895 (JINR-E-11-91-352) **Approximation formulae for functional integrals in $P(\Phi)_2$-quantum field theory.** Lobanov, Yu.Yu.; Zejnalova, O.V.; Zhidkov, E.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. 22p. Order Number DE93606067. Source: OSTI; NTIS (US Sales Only); INIS.

The approximation formulas for functional integrals with Gaussian measure in $P(\Phi)_2$ - quantum field theory are constructed. The formulas are exact on a class of polynomial functionals. Under determined conditions the convergence of approximations to exact value of the integral is proved, the speed of convergence is estimated. 17 refs.; 1 fig.; 4 tabs.

1896 (JINR-R-2-91-315) **Integrals of motion on the group of invariance of an interval in three-dimensional spaces.** Lukac, I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 23p. (In Russian). Order Number DE93606090. Source: OSTI; NTIS (US Sales Only); INIS.

The six parametrical group of motion of three-dimensional spaces with arbitrary constant metric conserving the square of distance between two points (the group of invariance of an interval) is considered. The special attention is paid to the group of transformations of an arbitrary homogeneous three-dimensional quadric which is a subgroup of the group of invariance of an interval. The Riemann geometry of this group space is studied and its geometrical characteristics (metric, Riemann's and Ricci's tensors, curvature etc.) are determined. The complete set of the integrals of motion on the group of invariance of an interval in three-dimensional spaces is found. The square of momentum, square of total angular momentum, helicity and square of spin are induced in the set of observables. 12 refs.

1897 (SLAC-PUB-5874) **CP violation.** Nir, Y. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Physics). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Sep 1992. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (WIS-92/167/Sep-PH;CONF-9207140-1: Stanford Linear Accelerator Center (SLAC) summer institute on particle accelerators: third family and the physics of flavor, Stanford, CA (United States), 13-24 Jul 1992). Order Number DE93001771. Source: OSTI; NTIS; INIS; GPO Dep.

We review the phenomenology of CP violation. the first part is a general discussion of CP violation in meson decays and in fermion electric dipole moments. The second part describes CP violation in in the Standard Model. The third part describes CP violation beyond the Standard Model. Our discussion is free of phase conventions and uses one language for the K and B systems, which gives further insight into the advantages of measuring CP violation in the β system.

1898 (ANL/CP-77129) **Schwinger Dyson equations: Dynamical chiral symmetry breaking and confinement.** Roberts, C.D. Argonne National Lab., IL (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9206280-1: Workshop on QCD vacuum structure, Paris (France), 1-5 Jun 1992). Order Number DE92040717. Source: OSTI; NTIS; INIS; GPO Dep.

A representative but not exhaustive review of the Schwinger-Dyson equation (SDE) approach to the nonperturbative study of QCD is presented. The main focus is the SDE for the quark self energy but studies of the gluon propagator and quark-gluon vertex are also discussed insofar as they are important to the quark SDE. The scope of this article is the application of these equations to the study of dynamical chiral symmetry breaking, quark confinement and the phenomenology of the spectrum and dynamics of QCD.

1899 (DOE/ER/40546-T2) **Theoretical particle physics: Progress report, FY 1992.** California Univ., San Diego, La Jolla, CA (United States). 30 Sep 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-90ER40546. Order Number DE93000649. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the following topics: heavy quark physics; Chiral Perturbation theory; Skyrmions; quarkonia and nuclear matter; parity violating nuclear matrix elements; how precisely can one determine M_U/M_D; weak scale baryogenesis; constraints of baryogenesis form neutrino masses; majorons, double beta decay, supernova 1987A; rare decays; chiral lattice fermions; Pauli-Villars regulator and the Higgs mass bound; and Higgs and Yukawa interactions.

1900 (DOE/ER/40682–13) **Oblique electroweak corrections from heavy scalar fields.** Li, Ling-Fong. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Physics. [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40682. (CMU-HEP–92-18). Order Number DE93002646. Source: OSTI; NTIS; INIS; GPO Dep.

The contributions of heavy scalar fields to the oblique electroweak correction parameters S and T are discussed with an emphasis of the decoupling properties of these contributions. It turns that in the decoupling limit, we also get the custodial symmetry.

1901 (DOE/ER/40698–1) **Experimental investigations of strong interactions in non-perturbative QCD region: Annual progress report, January 16, 1992–January 15, 1993.** Lindenbaum, S.J.; Samuel, S. City Coll., New York, NY (United States). Dept. of Physics. 9 Sep 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER40698. Order Number DE92041153. Source: OSTI; NTIS; INIS; GPO Dep.

We have experimentally investigated the reactions $\pi^- p \rightarrow \phi\phi n$ (OZI forbidden), $\phi K^+K^- n$ (OZI allowed), $K^- p \rightarrow \phi\phi\{\sigma^\lambda\}$ (OZI allowed), $\phi K^+K^-\{\sigma^\lambda\}$(OZI allowed), $\bar{p}p \rightarrow \phi\,\phi\,\pi^0$ (OZI forbidden), $\phi K^+K^-\pi^0$ (OZI allowed). By comparing the OZI forbidden (glueball filter) reactions with the OZI allowed and taking a global view we hope to critically test our hypothesis that the g_T (2010), $g_{T'}$ (2300), and g_T''(2340) all with $I^GJ^{PC} = 0^+2^{++}$ are produced by 1–3 2^{++} glueballs. We have searched for a Quark-Gluon Plasma by using 14.6 GeV/c x A Si ions incident on Au, Cu and Si. The novel detector used was a large solid angle TPC system. Although we found considerable strangeness enhancement this is explainable by conventional cascade physics including N* production. We have been engaged in phenomenological analyses in both glueball and heavy ion work. We have found that the θ(1720) is the same as the 0^{++} f_0(1720) we discovered earlier. Furthermore that the G(1590) can be explained as a sum of the f_0(1400) and f_0(1720) and does not require a new resonant state. We have also found that the strangeness enhancement discovered in heavy ion collisions so far is explainable by conventional physics. We are in the STAR Collaboration at RHIC which uses a large TPC system to search for a Quark-Gluon Plasma.

1902 (IC–92/153) **Baryonic currents and their correlators in the heavy quark effective theory.** Grozin, A.G. (Budker Inst. of Nuclear Physics, Novosibirsk (Russian Federation)); Yakovlev, O.I. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 19p. Order Number DE93604313. Source: OSTI; NTIS (US Sales Only); INIS.

HQET currents with the quantum numbers of the ground-state baryons are discussed. One-loop anomalous dimensions are calculated, and exact one-loop matching to QCD currents is found. Two-point correlators of these currents ar calculated taking into account $d \leq 9$ terms of the OPE. Sum rules for heavy baryons Λ_Q and $\Sigma_Q^{(*)}$ are analyzed. Three-point correlators of two baryonic currents and a heavy-heavy velocity changing current are calculated with the same accuracy. The baryonic Isgur-Wise form factors are estimated from the corresponding sum rules. (author). 27 refs, 7 figs.

1903 (IC–92/155) **Effective four-fermion interactions and dynamical breaking of electroweak symmetry.** Zhou Bangrong. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 13p. Order Number DE93604256. Source: OSTI; NTIS (US Sales Only); INIS.

A general research on the Nambu-Jona-Lasinio mechanism is conducted in the bubble approximation and the feasibility of minimal dynamical breaking of the electroweak gauge group $SU_L(2)xU_Y(1)$ induced by four-fermion interactions among one generation of fermions is expanded. The configurations of allowed composite Higgs and Goldstone bosons depend on the ratio between two independent four-fermion coupling constants and can be simply read out from the four-fermion Lagrangian. The implication of many-generation extension of the research for the fine-tuning problem is conceived. (author). 6 refs.

1904 (IC–92/164) **Flavour democracy calls for the fourth generation.** Datta, A. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 9p. Order Number DE93604257. Source: OSTI; NTIS (US Sales Only); INIS.

It is argued with the help of an illustrative mode, that the inter species hierarchy among the fermion masses and the quark mixing angles can be accommodated naturally in the standard model with (approximate) flavour democracy provided there are four families of sequential quark-leptons with all members of the fourth family having roughly equal masses. The special problem of light neutrino masses (if any) and possible solutions are also discussed. (author). 15 refs.

1905 (IC–92/186) **Bethe-Salpeter equation for non-self conjugate mesons in a power-law potential.** Ikhdair, S.M. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 10p. Order Number DE93606104. Source: OSTI; NTIS (US Sales Only); INIS.

We develop an approach to the solution of the spinless Bethe-Salpeter equation for the different-mass case. Although the calculations are developed for spin-zero particles in any arbitrary spherically symmetric potential, the non-Coulombic effective power-law potential is used as a kernel to produce the spin-averaged bound states of the non-self-conjugate mesons. The analytical formulae are also applicable to the self-conjugate mesons in the equal-mass case. The flavor-independent case is investigated in this work. The calculations are carried out to the third-order correction of the energy series. Results are consistent with those obtained before. (author). 14 refs, 1 tab.

1906 (IC–92/193) **Majoron models and the Higgs search.** Joshipura, A.S. (International Centre for Theoretical Physics, Trieste (Italy)); Rindani, S.D. International Centre for Theoretical Physics, Trieste (Italy). Aug 1992. 10p. Order Number DE93606092. Source: OSTI; NTIS (US Sales Only); INIS.

If the SU(2) x U(1) model is extended by adding a complex singlet spin-zero field and a spontaneously broken global U(1) symmetry, a Higgs scalar can decay into a pair of Goldstone bosons. This decay could dominate over the conventional decay modes into fermion-antifermion pairs. If that happens, then the standard Higgs search through its ZZ^*H coupling would not be able to detect the Higgs allowing it to be lighter than implied by the already existing limits from the LEP data on e^+e^- annihilation. Detailed restriction on the Higgs mass and other parameters of the model are derived using the existing LEP data on the standard model Higgs search in the mass region 10-50 GeV. (author). 13 refs, 2 figs.

1913 (JINR-E–2-90-569) **Higgs-Higgs interaction up to higher orders of perturbation theory in the standard model 1: Self-energy and vertex diagrams.** Dvoeglazov, V.V. (Saratovskij Gosudarstvennyj Univ., Saratov (Russian Federation)); Kikot', V.I.; Skachkov, N.B. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1990. 25p. Order Number DE93606093. Source: OSTI; NTIS (US Sales Only); INIS.

The self-energy and vertex blocks that enter in the Higgs-Higgs amplitude in the fourth order of perturbation theory in the framework of $SU(2)_L xU(1)$ gauge theory with an arbitrary number of fermions are calculated. The form of the corresponding counter terms is found. The calculations are done in an unitary gauge. The renormalization scheme is analogous to that suggested by Sirkin. 12 refs.; 14 figs.

1914 (JINR-E–2-90-570) **Higgs-Higgs interaction up to higher orders of perturbation theory in the standard model 2: Box diagrams and one-loop amplitude.** Dvoeglazov, V.V. (Saratovskij Gosudarstvennyj Univ., Saratov (Russian Federation)); Kikot', V.I.; Skachkov, N.B. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1990. 15p. Order Number DE93606094. Source: OSTI; NTIS (US Sales Only); INIS.

The Higgs-Higgs amplitude up to the fourth order of perturbation theory is calculated in the framework of $SU(2)_L xU(1)$ gauge theory with an arbitrary number of fermions. The renormalization scheme is analogous to that suggested by Sirlin. The calculations are done in a unitary gauge. 10 refs.; 7 figs.

1915 (JINR-E–2-91-95) **Spin-dependent structure functions of sea quarks in the framework of nonperturbative QCD and new Regge trajectory.** Dorokhov, A.E. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics); Kochelev, N.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 7p. Order Number DE93606105. Source: OSTI; NTIS (US Sales Only); INIS.

Within the model of QCD vacuum as an instanton liquid the spin-dependent structure functions of sea quarks are obtained. It is shown that the EMC data manages the definition of new Regge trajectory connected with the axial anomaly. The model explains the modern experimental data on the sea quark structure functions. 23 refs.; 3 figs.

1916 (JINR-E–2-91-393) **Low-energy predictions of SUSY GUTs: minimal versus finite model.** Kazakov, D.I. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics); Kondrashuk, I.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 19p. Order Number DE93606095. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Int. J. Mod. Phys. A.

The low-energy predictions are considered for $\sin^2\Theta_W$ and proton lifetime of SUSY GUTs along the lines of paper. Special attention is paid to the dependence on the mass spectrum of superpartners and possible heavy inhabitants of the Great desert. The minimal and finite SUSY SU(5) models with light and heavy t-squark and additional higgsino are considered. It is shown that modern precise LEP data are naturally reproduced within the finite SUSY SU(5) GUT. 15 refs.; 2 figs.; 1 tab.

1917 (JINR-E–2-91-517) **Standard model without Higgs particles.** Kovalenko, S.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 14p. Order Number DE93606096. Source: OSTI; NTIS (US Sales Only); INIS.

A modification of the standard model of electroweak interactions with the nonlocal Higgs sector is proposed. Proper form of nonlocality makes Higgs particles unobservable after the electroweak symmetry breaking. They appear only as a virtual state because their propagator is an entire function. We discuss some specific consequences of this approach comparing it with the conventional standard model. 12 refs.

1918 (JINR-R–2-91-322) **Role of mixed state in statistical models of deconfinement.** Kadantseva, E.P.; Shanenko, A.A.; Yukalov, V.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 14p. (In Russian). Order Number DE93606100. Source: OSTI; NTIS (US Sales Only); INIS.

The deconfinement in nonstratified mixtures of the gluon plasma and glueballs (the SU(2) and SU(3) cases), and of the quark-gluon plasma and hadrons is investigated. The confinement in these systems is found do be a phase transition of second order or of first order close to second order. Taking into account the heterophase states allows us to obtain the results that are in a good agreement with lattice calculations. 39 refs.; 8 figs.

1919 (JINR-R–4-91-447) **The ring electromagnetic model of the charged lepton.** Matora, I.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 4p. (In Russian). Order Number DE93606097. Source: OSTI; NTIS (US Sales Only); INIS.

The earlier proposed ring model of charged leptons of the electron and muon has been predicted. The choice of only one model parameter leads to the coicidence of the model characteristics with the existing data on both particles. 5 refs.

1920 (LU-TP–92-8) **Multiplicity distributions in QCD cascades.** Gustafson, G. Lund Univ. (Sweden). Dept. of Theoretical Physics. Mar 1992. 29p. Order Number DE93604290. Source: OSTI; NTIS; INIS.

Multiplicity distributions for hadrons and for jets are studied in QCD parton cascades. The colour dipole formalism is used and earlier results in the double log approximation are generalized to include terms which are suppressed by colour factors or factors of ln s. The result is a set of coupled differential equations, together with appropriate boundary conditions.

1921 (NIKHEF-H/K–92-01) **Nucleon structure functions from deep inelastic muon scattering.** Botje, M.A.J. (Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H). NIKHEF-H - NIKHEF-K - Collaboration. Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). 1992. 10p. (CONF-9203154–: 27. Rencontres de Moriond, QCD and high energy hadronic interactions,

Les Arcs (France), 22-28 Mar 1992). Order Number DE93604291. Source: OSTI; NTIS; INIS.

The New Muon Collaboration has measured deep inelastic muon scattering simultaneously on hydrogen and deuterium at incident muon energies of 90 and 280 GeV. The data cover a wide kinematic range $0.008<x<0.7$ and $0.8<Q^2<50$ GeV^2. Preliminary results are presented on the nucleon structure functions F_2^p and F_2^d. In the region of kinematic overlap the data are in good agreement with previous results from SLAC and BCDMS ($x>0.07$) but disagree with those obtained from a recent analysis of the NMC data. Good agreement is found between theory and data. The flavour non-singlet and singlet quark distributions as well as the gluon distribution are extracted with good precision down to low values of x (0.008). These results are compared to low-x extrapolations based on recent parton distribution fits. Also given is a preliminary result on the strong coupling constant α_S. 16 refs.; 7 figs.

1922 (RAL–92-030) **Reexamining the fermion mass relations in the supersymmetric SU(4)xO(4) GUT model.** Ranfone, S.F. Rutherford Appleton Lab., Chilton (United Kingdom). May 1992. 12p. Order Number DE93604260. Source: OSTI; NTIS (US Sales Only); INIS.

We study in detail the charged fermion masses in the context of the minimal Grand Unified Theory (GUT)- version of the supersymmetric SU (4) "x" O (4) model. We show how the presence of vacuum expectation values (VEVs) of the order of the GUT mass scale for the right-handed (RH) sneutrinos may modify the "naive" equality of the charged-lepton and the down-quark masses at $M_G = 10^{16}$ GeV. In particular, we indicate how one can successfully modify the problematic low-energy relation between m_e and m_μ, while preserving the good prediction $m_b/m_\tau = r \simeq 2.7$ (r being the renormalization parameter). The fact that the VEVs of the RH sneutrinos are predicted to be of order $\approx M_G$, may also have interesting consequences in the mechanism of symmetry breaking of the model. (Author).

1923 (RAL–92-035) **A novel scenario for neutrino masses in superstring-inspired GUT models.** Ranfone, S.; Papageorgiu, E. Rutherford Appleton Lab., Chilton (United Kingdom). Jun 1992. 7p. Order Number DE93606098. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that the usual "super-suppression" of the standard neutrino masses in the context of the SU(4) x O(4) and the flipped SU(5) x U(1) models may be avoided in the presence of large vacuum expectation values (VEV's) of order M_{GUT} for the right-handed sneutrinos, which have been introduced as a means to improve the mass relations between the down-type quarks and the charged leptons in the first of the two models. (author).

1924 (ANL-HEP-TR–92-59) **Estimates of rates and errors for measurements of direct-γ and direct-γ + jet production by polarized protons at RHIC.** Beddo, M.E.; Spinka, H.; Underwood, D.G. Argonne National Lab., IL (United States). High Energy Physics Div. 14 Aug 1992. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92041108. Source: OSTI; NTIS; INIS; GPO Dep.

Studies of inclusive direct-γ production by pp interactions at RHIC energies were performed. Rates and the associated uncertainties on spin-spin observables for this process were computed for the planned PHENIX and STAR detectors at energies between $\sqrt{s}$ = 50 and 500 GeV. Also, rates were computed for direct-γ + jet production for the STAR detector. The goal was to study the gluon spin distribution functions with such measurements. Recommendations concerning the electromagnetic calorimeter design and the need for an endcap calorimeter for STAR are made.

1925 (BNL–47885) **The status of investigations of 0^{++} and 2^{++} glueball states and new searches for exotic hybrid and glueball states.** Lindenbaum, S.J. (City Coll. of New York, NY (United States)). Brookhaven National Lab., Upton, NY (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016 ;FG02-92ER40698. (CONF-920837–5: 26. international conference on high energy physics, Dallas, TX (United States), 6-12 Aug 1992). Order Number DE92041312. Source: OSTI; NTIS; INIS; GPO Dep.

A coupled channel analysis of the $J^P = O^{++}$ and 2^{++} channels has been performed and will be further refined. The most prominent glueball candidates to date have been found in these channels. In the O^{++} channel the SLAC $\theta(1720)$ has the same quantum numbers and parameters as the $S^*(1710)$, a state discovered earlier at BNL. Thus for the purposes of this analysis they are assumed to be the same particle. In this analysis, which requires the minimum number of poles to fit the data, the G(1590) is not necessary and the experimental data in various channels can be represented by an overlapping mixture of the $f_0(1400)$ and the $f_0(1720)$. This coupled channel analysis is limited to energies below 2 GeV since there is not data in a sufficient number of channels above 2 GeV to do a coupled channel analysis. The only glueball candidates above 2 GeV are the $g_T(2010)$, $g_T'(2300)$ and $g_T''/1(2340)$ and they only appear in the $\phi\phi$ decay channel (an OZI forbidden channel). It is found that three meson poles for O^{++} and four meson poles for 2^{++} are the minimum necessary to fit the data. The various phase motions and data fits supporting the conclusions of Ref. 3 will be presented and discussed and the present status of the analysis presented. A BNL/CCNY/Fermilab/RPI collaboration is at present measuring at 8 GeV/c beam incident on hydrogen $K^-p \rightarrow \phi\phi\ (\Sigma^\Lambda)$, $p\bar{p} \rightarrow \phi\phi\pi^0$ and $\pi^- p \rightarrow \phi\phi n$. The above channels where one or both ϕ's are replaced by a K^+K^- pair are also observed. The object is to search for glueball(s) and exotic hybrids by comparing OZI forbidden and allowed channels. A description of this experiment and a status report will be made.

1926 (CRN–92-15) **Study of D^* charmed meson production in Z^0 boson decays observed by the DELPHI experiment at LEP.** Benedic, D. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires; Strasbourg-1 Univ., 67 (France). Dec 1991. 121p. (In French). Order Number DE93721015. Source: OSTI; NTIS (US Sales Only); INIS.

The work presented in this thesis has been performed on the DELPHI experiment, at the CERN large electron-positron collider LEP. The main purpose of this thesis is the study of charmed mesons D^* produced in the hadronic decays of the Z neutral. At first we will describe the theoretical framework by presenting the Standard Model, the fragmentation models and the heavy quark physics. The DELPHI detector is then described and especially the track detectors which are the main detectors in our analysis. Two studies of charged D^* mesons are then presented. In the first one around 170 D^{*+} decaying into D neutral π^+ were reconstructed, where the D neutral decays into $K^-\pi^+$ or $K^-\pi^+\pi^-\pi^+$. From the $X_E = E(D^{*+})/E_{beam}$ distribution, the production rate of D^{*+} in Z neutral hadronic decays is computed. Fixing the b quark fragmentation function, the D^{*+} rate from charm quark and the average $\langle X_E \rangle_c$ are measured. The partial width Γ_c is also measured. The following results were obtained: $Br(Z_{had} \rightarrow D^{*+}X)$. B_*B_o = (4.54 +- 0.54 (stat) $\pm$ 0.55(syst)).10^{-3} $\langle X_E \rangle_c = 0.51 \pm 0.03$(stat) $\pm$ 0.02(syst) $\Gamma_c/\Gamma_{had} = 0.157 \pm 0.031$(stat) $\pm$ 0.041(syst) where B_*B_o is the product $Br(D^{*+} \rightarrow D$ neutral $\pi^+).Br(D$ neutral $\rightarrow K^-\pi^+)$. In the second study the production rate of cantic events is derived from the inclusive analysis of charged pions coming from the decay of charmed mesons $D^{*+} \rightarrow D$ neutral π^+ where the π^+ is constrained by kinematics to have a low P_T with respect to the jet axis. The amount of D^{*+} counted by this method is ten times greater than in the first study. We have thus measured: $\Gamma_c/\Gamma_{had} = 0.122 \pm 0.011$stat $\pm$ 0.028(syst).

1927 (DOE/ER/40389–75) **Experimental investigations in particle physics at intermediate energies: [Annual] performance report, December 1, 1991–November 30, 1992.** Auerbach, L.B.; Highland, V.L.; McFarlane, K.W.; Kettell, S.H. Temple Univ., Philadelphia, PA (United States). Dept. of Physics. 12 Jul 1992. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER40389. Order Number DE93000406. Source: OSTI; NTIS; INIS; GPO Dep.

The major emphasis of this project continues to be on fundamental symmetries and parameters of the Standard Model. A test of a quark model prediction was also done. The projects in the current

period have been the following: LSND, a neutrino oscillation experiment at LAMPF; E791, a search for the decays $K_L^0 \rightarrow \mu e$ and $K_L^0 \rightarrow ee$; E871, tests and preparations for an upgrade proposal; and E888, a search for the H dibaryon. The LSND (Large Scintillator Neutrino Detector) is under construction at this time. Progress in the construction schedule has been accelerated with the expectation of being ready to accept beam in March 1993. The automated system for testing photomultiplier tubes is in full production, and should be able to certify a fun complement of tubes for installation by October 1992. Results of an earlier LAMPF experiment, E764, on the interaction of muon neutrinos with carbon nuclei have been submitted for publication. A thorough 'blind' analysis of the E791 data set has just been brought to completion. Final results for the upper limits (90% C.L.) on the branching ratios for the decays $K_L^0 \rightarrow \mu e$ and $K_L^0 \rightarrow ee$ are 3.3×10^{-11} and 4.1×10^{-11}, respectively. The final result for the branching ratio for $K_L^0 \rightarrow \mu\mu$ from all the data (720 events) is $(7.0 \pm 0.4 \pm 0.2) \times 10^{-9}$. The potential of the E791 detector for rare K decays has reached its limit. Before disassembly it was used to mount a search (E888) for a possible long-lived six-quark state, the H. At the same time studies have been made of an upgraded version of the experiment (E871) that will make use of a portion of the existing apparatus.

1928 (DOE/ER/40662–1) **Experimental and theoretical high energy physics research: Annual progress report, September 1, 1991–September 31, 1992.** California Univ., Los Angeles, CA (United States). Dept. of Physics. [1992]. 111p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-91ER40662. Order Number DE93001495. Source: OSTI; NTIS; INIS; GPO Dep.

Progress in the various components of the UCLA High-Energy Physics Research program is summarized, including some representative figures and lists of resulting presentations and published papers. Principal efforts were directed at the following: (I) UCLA hadronization model, PEP4/9 e^+e^- analysis, $\bar{P}$ decay; (II) ICARUS and astroparticle physics (physics goals, technical progress on electronics, data acquisition, and detector performance, long baseline neutrino beam from CERN to the Gran Sasso and ICARUS, future ICARUS program, and WIMP experiment with xenon), B physics with hadron beams and colliders, high-energy collider physics, and the ϕ factory project; (III) theoretical high-energy physics; (IV) H dibaryon search, search for $K_L^0 \rightarrow \pi^0\gamma\gamma$ and $\pi^0\nu\bar{\nu}$, and detector design and construction for the FNAL-KTeV project; (V) UCLA participation in the experiment CDF at Fermilab; and (VI) VLPC/scintillating fiber R & D.

1929 (DOE/ER/40682–6) **CP violation in the decays $B^0 \rightarrow \Psi K_s$ and $B^0 \rightarrow \pi^+\pi^-$: A probe for new physics.** Soares, J.M.; Wolfenstein, L. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Physics. 27 May 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40682. (CMU-HEP–92-11). Order Number DE93002413. Source: OSTI; NTIS; INIS; GPO Dep.

We point out the strong correlation between the CP-violating asymmetries in the decays $B^o \rightarrow \Psi K_s$ and $B^o \rightarrow \pi^+\pi^-$ that is predicted by the Kobayashi-Maskawa model. This results in a very restricted allowed region for the asymmetries, and so their measurement will provide a powerful test of the standard model. To show how new physics may give very different results, we look at the predictions of a simple model where both the standard model and superweak contributions to the K^o and B^o mass matrices coexist. We find that, for possible values of the parameters, practically any values are allowed for the asymmetries.

1930 (DOE/ER/40682–7) **General results for the decays $D \rightarrow \pi\ell\nu$ and $B \rightarrow \pi\ell\nu$.** Wolfenstein, L. (Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory). Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Physics. [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40682. (CMU-HEP–92-12). Order Number DE93002412. Source: OSTI; NTIS; INIS; GPO Dep.

Results are given for the two form factors for $D \rightarrow \pi\ell\nu$ and $B \rightarrow \pi\ell\nu$ at the soft pion limit. The derivation depends only on pion PCAC and heavy quark spin symmetry. The usefulness of these results is discussed.

1931 (FNAL/C–92/232) **High energy elastic and diffractive scattering.** Shukla, S. Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1992. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9206292–1: International conference on physics in collisions, Boulder, CO (United States), 9-12 Jun 1992). Order Number DE93000762. Source: OSTI; NTIS; INIS; GPO Dep.

The developments in high energy pp and $p\bar{p}$ elastic scattering in the last 30 years are summarized. The Regge pole model and the geometrical models are reviewed and their agreement with experimental data discussed. The experimental method for measuring the total cross section and the ratio of the real to the imaginary part of the forward elastic scattering amplitude, p, is described. The asymptotic behavior of the total cross section at high energy is discussed in the light of the new results on $p\bar{p}$ elastic scattering at $\sqrt{s}$=1.8 TeV. Predictions from geometrical models and Regge phenomenology are compared with experimental data. The 2-gluon model of the Pomeron by Low and Nussinov is discussed. Future measurements on elastic pp and $p\bar{p}$ elastic scattering are discussed.

1932 (IC–92/156) **Composite vector leptoquarks in e^+e^-, γe, and $\gamma\gamma$ colliders.** Cieza Montalvo, J.E. (Sao Paulo Univ., SP (Brazil). Inst. de Fisica). International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 25p. Order Number DE93604385. Source: OSTI; NTIS (US Sales Only); INIS.

We study the signals for composite vector leptoquarks in e^+e^- colliders (LEP II, NLC and CLIC) through their effects on the production of jet pairs, as well as their single and pair productions. We also analyze their production in γe and $\gamma\gamma$ collisions. (author). 12 refs, 8 figs.

1933 (IC–92/161) **The $\eta \rightarrow \pi^0\gamma\gamma$ decay in chiral perturbation theory at the quark level.** Ivanov, A.N. (State Technical Univ., St. Petersburg (Russian Federation)); Troitskaya, N.I.; Nagy, M. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 10p. Order Number DE93604361. Source: OSTI; NTIS (US Sales Only); INIS.

The partial width of the $\eta \rightarrow \pi^0\gamma\gamma$ decay is calculated within the chiral perturbation theory at the quark level $(CHPT)_q$, exploiting the linear realization of chiral U(3)xU(3) symmetry: $\Gamma(\eta \rightarrow \pi^0\gamma\gamma)_{(CHPT)_q} = (0.24 \pm 0.05)$ eV. The result is not compared with the experimental one $\Gamma(\eta \rightarrow \pi^0\gamma\gamma)_{exp} = (0.85 \pm 0.19)$ eV. It is confirmed that despite the essential progress of the experimental measurement of the $\eta \rightarrow \pi^0\gamma\gamma$ decay the necessity of the remeasuring of $\Gamma(\eta \rightarrow \pi^0\gamma\gamma)$, proposed by Ebert and Volkov in 1979, is still actual. (author). 12 refs, 2 figs.

1934 (IC–92/185) **Neutrino oscillations and a new Faraday effect.** Anwar Mughal, M.; Ahmed, K. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 18p. Order Number DE93606111. Source: OSTI; NTIS (US Sales Only); INIS.

By analogy with the classical Faraday effect for the electromagnetic waves, a Faraday effect for massive neutrinos is found to be a somewhat generic description of neutrino oscillations when the neutrinos traverse a dense medium with or without a magnetic field. We further plot the Faraday angle for the solar neutrino problem as an illustration of the fact that the Faraday effect may yield a conceptually convenient parametrization of various neutrino oscillation scenarios. (author). 8 refs, 3 figs.

1935 (INIS-BR–2934, pp. 125-182) **Phenomenology.** Garcia C, C.A. (La Plata Univ. Nacional (Argentina). Dept. de Fisica). Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (In Spanish). (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields*. Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

A general view of the state-of-the-art on experimental physics of elementary particles is presented. (M.C.K.).

1936 (INIS-mf–13358, pp. 71) **Nonstrange isovector two-body decay modes of heavy mesons sensitive tests for annhilation contributions and final state interactions.** Lipkin, Harry J. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of

Physics). Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Physics. 1992. 169p. (CONF-9204195--: 1992 Israel Physical Society annual meeting, Rehovot (Israel), 15 Apr 1992). Abstract only. MESONS/decay; CP INVARIANCE; MESONS; DECAY

1938 (IYaF-90-136) **Parton's picture of the electroweak processes in high energy e^+e^--collisions.** Ivkin, A.V.; Nazirov, M.T.; Ping Wang; Kuraev, E.A. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 16p. Order Number DE93606107. Source: OSTI; NTIS (US Sales Only); INIS.

Radiative corrections are taken into account in principle to all orders of perturbation theory. Polarized and unpolarized cases are considered. Estimations of number of W^{+-}, W^+W^-, Z produced are given. 10 refs.

1939 (IYaF-90-147) **E^+e^--annihilation into hadrons and exclusive τ decays.** Ehjdelman, S.I.; Ivanchenko, V.N. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 13p. Order Number DE93606108. Source: OSTI; NTIS (US Sales Only); INIS.

New calculations of the branching ratios of the τ-lepton hadronic decays are presented based on the whole bulk of data on electron-positron annihilation into hadrons. Perspectives of future measurements of hadronic cross sections in Novosibirsk are discussed. 28 refs.

1940 (IYaF-91-67) **Minimal embedding of vector mesons into the low-energy effective chiral Lagrangian.** Kuraev, E.A.; Silagadze, Z.K. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 13p. Order Number DE93606123. Source: OSTI; NTIS (US Sales Only); INIS.

The work is aimed at studying the possibility of vector meson introduction to low-energy Lagrangian and phenomenologic application of vector meson dominance principles. Mathematic mechanism of vector meson minimal embedding to low-energy effective chiral lagrangian is considered. 15 refs.

1941 (IYaF-91-71) **Pion pair production in photon-photon collisions.** Blinov, A.E. (and others); Blinov, V.E.; Bondar, A.E. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 23p. Order Number DE93606114. Source: OSTI; NTIS (US Sales Only); INIS.

The process $\gamma\gamma \to \pi^+\pi^-$ has been measured with the detector MD-1 at VEPP-4. The two-photon reactions of e^+e^-, $\mu^+\mu^-$ and $\pi^+\pi^-$ pair production were separated using scintillation counters, Cherenkov counters and shower-range chambers. The radiation width $\Gamma_{\gamma\gamma}$ $f_2(1270)$=3.1±0.35±0.35 keV has been obtained. 27 refs.; 9 figs.

1942 (JINR-E-2-91-358) **On the subtleties of the spectrum of light meson resonances 1: The model.** Govorkov, A.B. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 12p. Order Number DE93606119. Source: OSTI; NTIS (US Sales Only); INIS.

It is found that the spectrum of radial and orbital excitations (with LS=0) of light mesons evaluated on the basis of a relativized potential quark model is consistent with experimentally observed resonances. The only exception is the radial excitation of K*(892). 5 refs.; 4 tabs.

1943 (JINR-E-2-91-359) **On the subtleties of the spectrum of light meson resonances 2: II. Data analysis.** Govorkov, A.B. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 14p. Order Number DE93606120. Source: OSTI; NTIS (US Sales Only); INIS.

A renewed analysis of the available experimental data on e^+e^--annihilation into $\pi\omega$ and $\pi^+\pi^-\pi^0$ hints at the existence of a superfluous $\rho\omega$(1200)-resonances, nonstrange partners of K*(1410). 10 refs.; 1 fig.; 4 tabs.

1944 (JINR-E-2-91-360) **Coupled-channel analysis of low energy nucleon-antinucleon interactions.** Henner, V.K. (Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Fizicheskij Fakul'tet); Meshcheryakov, V.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 20p. Order Number DE93606115. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Z. Phys. The Talk Given at Nucleon-antinucleon Conference (NAN 91), July 10, ITEP, Moscow, USSR.

Multichannel M-matrix method is applied to an NN-bar-system with taking into account elastic pp-bar-scattering, charge-exchange pp-bar→nn-bar reaction and pp-bar annihilation. It is shown that contrary to standard assumptions the isotopic invariance due the large influence of the charge exchange channel affects very significantly the parameters of strong interactions. Contrary to previous descriptions, M-matrix elements are treated as real functions. The differential and total cross-sections for pp-bar→pp-bar and pp-bar→nn-bar processes, cross-section δ_{tot}(pp-bar) and the real-to-imaginary ratio of the forward amplitude of elastic pp-bar scattering up to beam momenta p_{lab}=600 MeV/c are described. The fitting leads to a resonance in the s-wave at about p_{lab}=500 MeV/c and to bound states in p-wave near the pp-bar threshold. 33 refs.; 8 figs.; 3 tabs.

1945 (JINR-E-2-91-405) **Naive model of electromagnetic structure of octet baryons.** Dubnickova, A.Z.; Dubnicka, S.; Strizenec, P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 15p. Order Number DE93606124. Source: OSTI; NTIS (US Sales Only); INIS.

The structural three-resonance vector dominance model in a zero-width approximation with a strick Okulo-Zweig-lizuks rule consideration is used to parametrize Dirac abd Pauli electromagnetic form factors of octet baryons. In view of the simplicity of the model the obtained results on mean-square electric and magnetic radii of baryons are encoraging. 26 refs.; 2 tabs.

1946 (JINR-E-2-91-451) **Semileptonic decays of D- and B-mesons in the relativistic quark model.** Faustov, R.N. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics); Galkin, V.O.; Mishurov, A.Yu. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 13p. Order Number DE93606117. Source: OSTI; NTIS (US Sales Only); INIS.

The relativistic corrections to the semileptonic decay form factors of B- and D-mesons are calculated. The obtained form factors of the semileptonic decay agree with the experimental data. 25 refs.; 2 figs.; 1 tab.

1947 (JINR-E-2-91-465) **Determination of the strange quarks's contribution to the proton spin in semi-inclusive deep inelastic electroproduction of K and π mesons.** Alizade, V.N. (AN Azerbajdzhanskoj SSR, Baku (Azerbaijan). Inst. Fiziki); Efremov, A.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 10p. Order Number DE93606112. Source: OSTI; NTIS (US Sales Only); INIS.

A possibility of extracting pure contribution of s-quarks to the proton spin in the processes 1+A->1+h+X A=p,nN; h=K^+,K^0,K^0,π^+ show that measurements of the quantities $\delta\sigma^K$ and δv^π. 10 refs.; 1 fig.

1948 (JINR-E-2-91-475) **Towards the results of global analysis of data on nucleon electromagnetic structure.** Bilen'kaya, S.I.; Dubnicka, S.; Dubnickova, A.Z.; Strizenec, P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 14p. Order Number DE93606125. Source: OSTI; NTIS (US Sales Only); INIS.

Peculiar features of the recent global analysis of data on the nucleon electromagnetic structure are discussed on the detail in order to reconsider reliability of the predicted result that the electron-positron annihilation into a neutron-antineutron cross-section is considerably larger that the cross-section of the electron-positron annihilation into a proton-antiproton pair. 14 refs.; 3 figs.; 3 tabs.

1949 (JINR-E-7-91-365) **Investigation of β-delayed neutron emission and elastic scattering of neutron-rich isotopes of He and Li.** Skobelev, N.K.; Lukanov, S.M.; Penionzhkevich, Yu.E.; Sokol, E.A.; Tret'yakova, S.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions. 1991. 12p. Order Number DE93606121. Source: OSTI; NTIS (US Sales Only); INIS.

One of the methods to obtain lightest neutron-rich nuclei as secondary beams is described. Secondary beams are formed a nuclear reaction due to heavy ions with the energy of ~20 MeV/nucleon. The data analysis of the measured elastic cross-section shows, that the peripheral ^{9}Li interaction region has a rather high transparency. Strong dynamical polarization of the ^{9}Li nucleus in the field of the heavy nucleus of ^{208}Pb in the process of scattering is proposed. 24 refs.; 6 figs.; 3 tabs.

1950 (LAL–92-21) **Study of jet production in H1 detector at HERA. Application to $\alpha_s(Q^2)$ determination.** Devel, M. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. May 1992. 174p. (In French). Order Number DE93721028. Source: OSTI; NTIS (US Sales Only); INIS.

Measuring the fractions of events with a given number of hadronic jets should enable the HERA physicists to observe the evolution of α_s as a function of Q^2, hence to measure Λ_{QCD}. For that purpose, after a study of the calorimeter performances, we have developed a jet-finding algorithm, optimized so that it excludes the remnants of the proton from the jet making process. With this algorithm, the ratio of the number of events with two reconstructed jets over the number of events with one reconstructed jet has been studied. A clear dependence with Λ_{QCD} and Q^2 is observed. We have then defined a kinematic zone in which the acceptance corrections are below a few percent and the reconstruction of the kinematic variables well under control: $0.01 \leq x \leq 0.1$; $200\ GeV^2 \leq Q^2 \leq 9840\ GeV^2$. Using an integrated luminosity of 100 pb^{-1}, we find that, in this zone, it will be possible to measure Λ_{QCD} with a statistical error of the order of 3%. Moreover, with the same luminosity and points in the (x,Q^2) plane defined with a precision of 10%, one should observe the evolution of α_s with a statistical precision $\delta\alpha_s$ of the order of 0.03.

1951 (LAL–92-26) **New results on direct CP violation from the NA31 experiment.** Perdereau, O. NA31 Collaboration. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire; Paris-11 Univ., 91 - Orsay (France). May 1992. 8p. (CONF-9203197–: 27. Rencontres de Moriond: 'Electroweak Interactions and Unified Theories', Les Arcs (France), 15-22 Mar 1992). Order Number DE93721704. Source: OSTI; NTIS (US Sales Only); INIS.

The NA31 experiment has published the first evidence for direct CP violation by measuring a non-zero value for the $Re(\epsilon'/\epsilon)$ parameter. Further data-taking periods took place in 1988 and 1989, producing two datasets with statistics comparable to the original one. This paper presents the final result of the analysis of the 1988 dataset together with a preliminary result of the analysis of the 1989 one. The Combined, preliminary, measurement of NA31 is $Re(\epsilon'/\epsilon) = (2.3 \pm 0.7)\ 10^{-3}$, thus confirming our initial measurement and also in agreement with the standard model.

1952 (PCCF-RI–92-07) **Heavy quark production and decay at LEP.** Falvard, A. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. 1992. 72p. (In French). (CONF-9109440–: 23. School on Particle Physics: Electroweak properties of heavy quarks, Palaiseau (France), Sep 1991). Order Number DE93721002. Source: OSTI; NTIS (US Sales Only); INIS.

This lesson is divided in 3 parts. In the first part, tests of electroweak Standard Model that can be performed in studying the Z → b anti b,c anti c coupling are presented. The second part shows the possibilities of B anti B mixing measurement and which statistics is necessary to have significant results. And finally, in the last part, the author looks after which are the possibilities to have interesting results about the life time measurement of beauty hadrons.

1953 (PCCF-T–91-01) **Experimental study of pions plus on the proton at threshold. Contribution at nucleon axial form factor measurement.** Elouadrhiri, L. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. May 1991. 137p. (In French). Order Number DE93721004. Source: OSTI; NTIS (US Sales Only); INIS.

We are in the process of measuring the nucleon axial form factor, $g_A(k^2)$, using pion electroproduction at threshold for the four-momentum transfers of -1.8, -3.5, -5.0 fm^{-2}. The electron and pion have been detected in coincidence. The reconstructed missing mass of the neutron identifies the reaction. The experiment used the electron beam of the Linear Accelerator of Saclay (ALS) and a liquid hydrogen target. A complete detection arm for low energy pions was designed and built for this experiment. After justifying the motivations of our experiment, we present a detailed description of the experimental apparatus and its methods, as well as the process used to reconstruct the pion momentum. We explain in details the experimental conditions during data taking and the analysis method, which consists in extracting very small cross sections from a large background. Finally we present the complete set of cross sections for the lowest four-momentum transfer: $-1.8fm^{-2}$. 31 figs., 15 tabs.

1954 (RAL–92-021) **New information on parton distributions.** Martin, A.D. (Durham Univ. (United Kingdom). Dept. of Physics); Stirling, W.J.; Roberts, R.G. Rutherford Appleton Lab., Chilton (United Kingdom). Apr 1992. 49p. (DTP–92/16.). Order Number DE93604340. Source: OSTI; NTIS (US Sales Only); INIS.

New data on structure functions from deep-inelastic scattering provide new information on parton distributions, particularly in the $0.01 < x < 0.1$ interval. This has important implications for predictions for the HERA ep collider and for present and future high energy hadron colliders. We present the results of updated fits to all available precision structure function and related data. We focus in particular on two issues: the increase in the sea quark distributions at small x implied by new F_2 data from the New Muon Collaboration (NMC) and its implications for other processes, and the evidence for SU(2) symmetry breaking in the light quark sea. We show that although good fits can be obtained with or without this symmetry breaking, more physically reasonable parton distributions are obtained if we allow d-bar > u-bar at small x. With the inclusion of the latest deep-inelastic data we find $\alpha_s(M_Z) = 0.111^{+0.004}_{-0.005}$. We also show how W, Z and Drell-Yan production at p-barp colliders can give information on parton distributions. (Author).

1955 (RAL–92-037) **Analysing $\gamma\gamma \to \pi\pi$ and what it can tell us.** Morgan, D. Rutherford Appleton Lab., Chilton (United Kingdom). Jun 1992. 12p. Order Number DE93606113. Source: OSTI; NTIS (US Sales Only); INIS.

To appear in Proc. Photon-photon '92 (9. International workshop on photon-photon collisions), San Diego, CA (US), 22-26 Mar 1992.

Among $\gamma\gamma$ reactions, the process $\gamma\gamma \to \pi\pi$ is particularly favoured for amplitude analysis. The combination of quite detailed data on both charge channels and exceptionally prescriptive theoretical constraints allows a full prediction of the low energy cross-section and a detailed amplitude analysis through the $f_2(1270)$ region. Key issues that may thereby be explored are the coupling to $\gamma\gamma$ of the broad I = 0 S-wave resonance and, the capacity of precise low energy $\gamma\gamma \to \pi\pi$ data to refine our knowledge of the $\pi\pi$ I = 0 scattering length, a_0^0. (author).

1956 (CEA-LNS-Ph–92-17) **Excitation of the Roper resonance and study of higher baryon resonances.** Morsch, H.P. (Laboratoire National Saturne, Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France)). Laboratoire National Saturne, Centre d'Etudes

de Saclay, 91 - Gif-sur-Yvette (France). 1992. 12p. (CONF-9205256–: 6. SATURNE days, Mont Sainte-Odile (France), 18-22 May 1992). Order Number DE93721699. Source: OSTI; NTIS (US Sales Only); INIS.

The region of the P_{11} resonance N(1440) is investigated in inelastic α-scattering on hydrogen using alpha-particles from Saturne with a beam momentum of 7 GeV/c. In the missing mass spectra of the scattered α-particles two effects are observed, excitation of the projectile, preferentially excited to the Δ-resonance, and excitation of the Roper resonance. The large differential cross sections indicate a structure of a compression mode. From this the compressibility of the nucleon K_N may be extracted. The Roper resonance excitation corresponds to a surface mode which may be related to an oscillation of the meson cloud. The other monopole mode which corresponds to a vibration of the valence quarks should lie at about 800 MeV of excitation or above. This is the region of the P_{11}(1710 MeV) resonance. Therefore experiments are important to measure the monopole strength in this energy region. Another interesting aspect is the scalar polarizability which can be extracted from inelastic dipole excitations (squeezing modes) as excitation energies above 500 MeV.

1957 (DOE/ER/40546–T1) **Studies in theoretical particle physics: Progress report.** Kaplan, D.B. California Univ., San Diego, CA (United States). 1 Aug 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-90ER40546. Order Number DE93000648. Source: OSTI; NTIS; INIS; GPO Dep.

This report focuses on research on three distinct areas of particle physics: Chiral Fermions on the Lattice; Weak Scale Baryogenesis; analysis of parity violating nuclear forces, and other an attempt to render the electric dipole moment of the neutron immune from quantum gravity corrections.

1958 (IC–92/196) **Planck scale effects in neutrino physics.** Akhmedov, E.Kh. (International Centre for Theoretical Physics, Trieste (Italy)); Senjanovic, G.; Tao Zhijan; Berezhiani, Z.G. International Centre for Theoretical Physics, Trieste (Italy). Aug 1992. 22p. (SISSA–140/92/EP;LMU–09/92.). Order Number DE93606133. Source: OSTI; NTIS (US Sales Only); INIS.

We study the phenomenology and cosmology of the Majoron (flavon) models of three active and one inert neutrino paying special attention to the possible (almost) conserved generalization of the Zeldovich-Konopinski-Mahmoud lepton charge. Using Planck scale physics effects which provide the breaking of the lepton charge, we show how in this picture one can incorporate the solutions to some of the central issues in neutrino physics such as the solar and atmospheric neutrino puzzles, dark matter and a 17 keV neutrino. These gravitation effects induce tiny Majorana mass terms for neutrinos and considerable masses for flavons. The cosmological demand for the sufficiently fast decay of flavons implies a lower limit on the electron neutrino mass in the range of 0.1-1 eV. (author). 32 refs, 1 fig., 1 tab.

1959 (IN2P3–92-02) **Where is the Higgs-boson.** Cahn, R.; Froidevaux, D.; Grivaz, J.F.; King, S.F.; Mansoulie, B.; Taxil, P. Institut National de Physique Nucleaire et de Physique des Particules (IN2P3), 75 - Paris (France). 1990. 360p. (In French, English). (CONF-9009441–: Summer school of particle physics, Strasbourg (France), 3-7 Sep 1990). Order Number DE93720939. Source: OSTI; NTIS (US Sales Only); INIS.

The 22th session of Summer School on Particle Physics was held in Strasbourg from 3 to 7 September 1990. The subject 'Where is the Higgs' and all aspects of this question have been studied in lessons and discussions: actual researches of Higgs at LEP in the Standard Model or not, future researches in hadron collisions of very high energy and hard technical problems that the experiments set near to the future hadron colliders.

1960 (IN2P3–92-02, pp. 5-99) **A Higgs primer.** Cahn, R.N. (Lawrence Berkeley Lab., CA (United States)). Institut National de Physique Nucleaire et de Physique des Particules (IN2P3), 75 - Paris (France). 1990. (In French, English). Contract DE-ACO3.76SF00098. (CONF-9009441–: Summer school of particle physics, Strasbourg (France), 3-7 Sep 1990). In *Where is the Higgs-boson.* 360p. Order Number DE93720939. Source: OSTI; NTIS (US Sales Only); INIS.

The orthodox Higgs boson of the Standard Model is presented in a pedagogical fashion with an audience of experimentalists in mind, beginning with a presentation of spontaneously broken gauge theories. Basic calculations of decay rates to fermion-antifermion, to WW and ZZ, and $\gamma\gamma$ are displayed in detail. Production cross sections for Higgs bosons in both e^+e^- and proton-proton collisions are calculated. Special attention is given to processes that might be observed at LEP II, the LHC, or the SSC. The t antit condensate model is discussed and some elementary computations presented. The effect of a heavy Higgs boson on the W - Z mass splitting is determined.

1961 (IN2P3–92-02, pp. 101-143) **Higgs bosons beyond Minimal Standard Model.** Taxil, P. (Centre National de la Recherche Scientifique (CNRS), 13 - Marseille (France). Centre de Physique Theorique). Institut National de Physique Nucleaire et de Physique des Particules (IN2P3), 75 - Paris (France). 1990. (In French). (CONF-9009441–: Summer school of particle physics, Strasbourg (France), 3-7 Sep 1990). In *Where is the Higgs.* 360p. Order Number DE93720939. Source: OSTI; NTIS (US Sales Only); INIS.

This lesson covers some points of view of Higgs Bosons physics beyond the Minimal Standard Model: Minimal Supersymmetry Standard Model, non-minimal supersymmetric models, non supersymmetric models.

1962 (IN2P3–92-02, pp. 147-197) **Alternatives to Higgs scalars.** King, S. (Southampton Univ. (United Kingdom). Dept. of Physics). Institut National de Physique Nucleaire et de Physique des Particules (IN2P3), 75 - Paris (France). 1990. (In French). (CONF-9009441–: Summer school of particle physics, Strasbourg (France), 3-7 Sep 1990). In *Where is the Higgs.* 360p. Order Number DE93720939. Source: OSTI; NTIS (US Sales Only); INIS.

We discuss alternatives to the Higgs Scalar doublet Φ of the minimal standard model. In particular we review technicolor (TC) and extended technicolor (ETC), and show that the threat of flavour changing neutral currents (FCNC's) is avoided by walking TC and/or strongly coupled ETC. The phenomenology of minimal TC and the techni-family is discussed. Finally we consider the possibility that the Higgs doublet Φ is a composite bound state of quarks from the third (or fourth) family.

1963 (IN2P3–92-02, pp. 199-246) **Higgs boson research in e^+e^- collisions.** Grivaz, J.F. (Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire). Institut National de Physique Nucleaire et de Physique des Particules (IN2P3), 75 - Paris (France). 1990. (In French). (CONF-9009441–: Summer school of particle physics, Strasbourg (France), 3-7 Sep 1990). In *Where is the Higgs.* 360p. Order Number DE93720939. Source: OSTI; NTIS (US Sales Only); INIS.

This lesson is about the experimental results obtained in 1990, at LEP concerning Higgs boson research. The main topics studied are: Higgs boson research of minimal Standard Model, then beyond the minimal model, the charged Higgs boson research in 2-doublets model, and finally, neutral Higgs boson research in a specific 2-doublets model, the minimal supersymmetric standard model.

1964 (INIS-BR–2934, pp. 183-210) **Spin of proton.** Epele, L.N. (La Plata Univ. Nacional (Argentina). Dept. de Fisica). Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. 1969 (IYaF--90-123) **Electric dipole moment of the W-boson and the electron in the Kobayashi-Maskawa model.** Khriplovich, I.B.; Pospelov, M.E. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 10p. Order Number DE93606137. Source: OSTI; NTIS (US Sales Only); INIS.

In the Kobayashi-Maskawa model electric dipole moments of the W-boson and the electron do not arise in the two-loop and three-loop approximations respectively. 8 refs.; 9 figs.

1970 (IYaF--90-138) **Nonperturbative correction to the threshold production of t anti t-pairs.** Fadin, V.S.; Yakovlev, O.I. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 13p. Order Number DE93606138. Source: OSTI; NTIS (US Sales Only); INIS.

Calculations are performed of the nonperturbative correction to the cross-section for the tt-pair near the threshold in e^+e^--annihilation, which is connected with the existence of a gluon condensate. These have been made using a constant chromoelectric field approximation. 15 refs.

1971 (IYaF--91-11) **On the Higgs boson contribution to the tt-bar production threshold cross-section.** Fadin, V.S.; Yakovlev, O.I. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 6p. Order Number DE93606139. Source: OSTI; NTIS (US Sales Only); INIS.

The correction to the e^+e^-->tt cross section near the threshold which is due to the standard model Higgs exchange is calculated at $m_{Higgs} > m_t$. 8 refs.

1972 (LAL--92-23) **On the determination of a mass lower limit for the Higgs boson in the presence of candidate events.** Grivaz, J.F.; Le Diberder, F. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. Apr 1992. 8p. Order Number DE93721703. Source: OSTI; NTIS (US Sales Only); INIS.

A method is presented in which the mass resolution is taken into account to derive a mass lower limit for the neutral Higgs boson when candidate events are retained by the selection cuts.

1973 (LAL--92-27) **Will a Higgs boson be found at future e^+e^- colliders.** Janot, P. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire; Paris-11 Univ., 91 - Orsay (France). May 1992. 18p. (CONF-9203197--: 27. Rencontres de Moriond: 'Electroweak Interactions and Unified Theories', Les Arcs (France), 15-22 Mar 1992). Order Number DE93721705. Source: OSTI; NTIS (US Sales Only); INIS.

As the search for the standard Higgs boson is reaching its sensitivity limit at LEP 100, now is the time to explore the capabilities of the future e^+e^- colliders in this field. In particular, the second phase of LEP is studied, and the minimum integrated luminosity required for an efficient search up top $m_H \geq m_Z$ is given as a function of the various centre-of-mass energy hypotheses. The $\sqrt{s}$ = 500 GeV Next Linear Collider (NLC) is shown to easily cover the 'intermediate' mass region, $m_Z \geq m_H \geq 200$ GeV/c^2. Finally, the ability of these colliders to fully probe the MSSM via its neutral Higgs sector is demonstrated.

1974 (LAPP-T--90-04) **Study of resonances produced in $\pi^- p \rightarrow (\pi^0\omega)n$ and $(\pi^- p \rightarrow)(\pi^0\pi^0\omega)n$ at 100 GeV.** Bencheikh, B. Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules Elementaires. Dec 1990. 120p. (In French). Order Number DE93721024. Source: OSTI; NTIS (US Sales Only); INIS.

Dealing with quark light meson spectroscopy, reactions $\pi^- p \rightarrow (\pi^0\omega) n$, $(\pi^0\pi^0\omega) n$ measured at 100 GeV with the GAMS detector in the Na12 experiment at CERN are analysed. After a short description of the experimental set-up, selection of events and background substraction are discussed. The mass spectrum is dominated by the b_1 and ρ_3 mesons. Analysis of events produced at small momentum transfer shows for the first time the existence of a resonance with quantum numbers $J^{PC} = 1^{--}$, $I^G = 1^+$ at 2.1 GeV. This resonance is compatible with the two vector-mesons expected at 2 GeV in the quark model. A new structure is also observed at high momentum transfer at 1.6 GeV. This could corresponds to a radial excitation of the b_1 meson or to 2^{--} state both expected in the quark model. Study of $\pi^0\pi^0\omega$ selected events indicates clearly the existence on the $(\pi^0 b_1)$ mass spectrum of a structure at 1.9 GeV which is compatible with a hybrid state structure according to certain models based on QCD.

1975 (LA-UR--92-3192) **Neutrino mass and mixing, and non-accelerator experiments.** Robertson, R.G.H. Los Alamos National Lab., NM (United States). [1992]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920837--6: 26. international conference on high energy physics, Dallas, TX (United States), 6-12 Aug 1992). Order Number DE93000867. Source: OSTI; NTIS; INIS; GPO Dep.

We review the current status of experimental knowledge about neutrinos derived from kinematic mass measurements, neutrino oscillation searches at reactors and accelerators, solar neutrinos, atmospheric neutrinos, and single and double beta decay. The solar neutrino results yield fairly strong and consistent indication that neutrino oscillations are occurring. Other evidence for new physics is less consistent and convincing.

1976 (LA-UR--92-3194) **On the 17-keV conundrum.** Hime, A. Los Alamos National Lab., NM (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9206227--2: 15. international conference on neutrino physics, Granada (Spain), 7-13 Jun 1992). Order Number DE93000866. Source: OSTI; NTIS; INIS; GPO Dep.

Recent developments in pursuance of the 17-keV neutrino are discussed with emphasis upon experiments employing solid state detectors. Studies have shown that electron scattering effects are the likely origin of the anomalies observed in β decay spectra measured at Oxford and Guelph. While missing links remain, it is improbable that a 17-keV neutrino exists in nature and a resolution of this conundrum is within reach.

1977 (LA-UR--92-3208) **The experimental status of neutrino masses and mixings.** Robertson, R.G.H. Los Alamos National Lab., NM (United States). [1992]. 17p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9206251–2: Physics beyond the standard model III conference, Ottawa (Canada), 22-24 Jun 1992). Order Number DE93000862. Source: OSTI; NTIS; INIS; GPO Dep.

We review the current status of experimental knowledge about neutrinos derived from kinematic mass measurements, neutrino oscillation searches at reactors and accelerators, solar neutrinos, atmospheric neutrinos, and single and double beta decay. The solar neutrino results yield fairly strong and consistent indications that neutrino oscillations are occurring. Other evidence for new physics is less consistent and convincing.

1978 (LBL–32514) **From the ψ to charmed mesons: Three years with the SLAC-LBL detector at SPEAR.** Goldhaber, G. Lawrence Berkeley Lab., CA (United States). Jun 1992. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9206131–2: 3. international symposium on the history of particle physics - the rise of the standard model, Stanford, CA (United States), 24-27 Jun 1992). Order Number DE93000569. Source: OSTI; NTIS; INIS; GPO Dep.

As I look back at the first three years or so at SPEAR, I consider this one of the most revolutionary or perhaps the most revolutionary, experiment in the 60 year history of particle physics. It certainly was the most exciting time, in a laboratory that is, that I have ever experienced. In my talk I will cover the period 1973–1976 which saw the discoveries of the ψ and ψ' resonances the χ states and most of the Psion spectroscopy, the D^0, D^+ charmed meson doublet as well as the D^{0*} and D^{+*} doublet. I will also refer briefly to some more recent results. Most of the discoveries I will mention were made with the SLAC-LBL Magnetic Detector or "MARK I" which we operated at SPEAR from 1973 to 1976. In 1976 the MARK I was modified to include a "Lead Glass Wall" (LGW) for improved photon and electron detection. This involved a new physics group from LBL, who built the LGW, Lina Barbaro-Galtieri et al. as well as a continuing group from SLAC, Martin Perl and Gary Feldman et al. to provide continuity in the running of the MARK I and to continue the study of the anomalous $e\mu$events which Martin found earlier and which eventually were identified as the signature of the τ lepton.

1979 (PCCF-RI–92-04) **Study of H $\rightarrow \gamma\gamma$ decay.** Causse, M.B.; Dugne, J.J.; Montarou, G. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. 1992. 22p. (In French). Order Number DE93721706. Source: OSTI; NTIS (US Sales Only); INIS.

The authors study the H $\rightarrow\gamma\gamma$ decay in the Standard model and present the detailed calculation of scattering amplitude of this process involving Feynman diagrams of three points loops. The calculation of these diagrams can be effected in different gauges and involves fermion, gauge boson and phantom loops. The decay width of the process is derived in conclusion.

1980 (PCCF-RI–92-05) **Test of determination of nucleon structure functions in the hypothesis of scalar di-quark existence.** Tavernier, P.; Dugne, J.J. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. 1992. 33p. (In French). Order Number DE93721026. Source: OSTI; NTIS (US Sales Only); INIS.

The authors present the nucleon structure functions that have been obtained in the hypothesis of existence of a scalar di-quark, progressively broken by increasing energy of electromagnetic probe (Stockolm model). Comparisons with other models and experimental results are presented. 20 figs.

1981 (RAL–92-022) **Effective heavy quark theory.** Close, F.E. (Rutherford Appleton Lab., Chilton (United Kingdom)); Zhenping Li. Rutherford Appleton Lab., Chilton (United Kingdom). May 1992. 8p. Order Number DE93606140. Source: OSTI; NTIS (US Sales Only); INIS.

We show how heavy quark effective theory (HQET), including 1/M_Q corrections, may be matched onto dynamical quark models by making a specific choice of K_μ, m and υ_μ in the $p_\mu = m\upsilon_\mu + K_\mu$ expansion. We note that Wigner rotations of heavy quark spins arise at $O(p^2/m^2)$ in non-relativistic models but at $O(\Delta_{QCD}/M_Q)$ or O(velocity - transfer) in HQET and so are necessary for a consistent treatment. (author).

1982 (UCRL-JC–110734) **Determination of the neutrino mass from the beta decay of gaseous molecular tritium.** Decman, D.J.; Stoeffl, W. Lawrence Livermore National Lab., CA (United States). Jun 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9203162–3: International symposium on spectroscopy and structure of molecules and nuclei, Tallahassee, FL (United States), 27 Mar 1992). Order Number DE93001326. Source: OSTI; NTIS; INIS; GPO Dep.

We set an upper limit of 8 eV for the mass of the electron antineutrino from studying the beta decay of tritium. We use a gaseous molecular tritium source, a high resolution magnetic spectrometer and a low background counting system to minimize the systematic errors encountered in these measurements. Our calibration data with radioactive ^{83m}Kr enables us to measure our system response function and a good deal of atomic physics data. In addition to our end point results we have made the first measurement of the tritium beta decay spectrum below 200 keV. We find an excess of very low energy electrons which arise from molecular processes of the $^3He\text{-}T^+$ ion.

1986 (GANIL-RA–89-91) **Nuclear physics at Ganil. A compilation 1989-1991.** Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1991. 229p. Order Number DE93720999. Source: OSTI; NTIS (US Sales Only); INIS.

This compilation deals with experimental and theoretical work performed at GANIL for the 1989-1991 years about the nuclear structure and nuclear reactions. During this period, the accelerator performances have been strongly increased, as well for the delivered energies and intensities as for the span of accelerated ions. In the experimental areas, a totally new data acquisition system has been set up, and the adding of a Wien filter to the Lise spectrometer results now in a versatile and efficient isotope separator, called LISE III. The time structure and the large intensity of the beam were decisive in identifying, for the first time, kaon production in heavy ions collisions at the GANIL subthreshold energies. Nucleons have to undergo several collisions before inducing such a process, and the strange particle emission should be very sensitive to the physical conditions of the hot and compressed interacting zone. Lead and Uranium beams now available at the Fermi energy,

have been used to study the nuclear disassembly of very large and heavy systems. New results have been obtained on the collective flow in heavy ion reactions, giving new insights on the Equation of State problematics. In the field of nuclear structure, the magnetic spectrometer SPEG, coupled with large particle or gamma detectors shed light on new aspects of the giant resonance excitations. Exotic nuclei are extensively studied, with a particular emphasis on the 11Li nucleus. A new method of mass measurement, using the CSS2 as a mass separator, has been successfully tested; it will greatly improve the accuracy achieved on intermediate and heavy nuclei. Last but not least, the theory group is actively working to include fluctuations in the description of the nuclear dynamics and to characterise the onset of the multifragmentation process in heavy ion collisions. Author index and publication list are added.

The 1990-1991 activity report of Nuclear Physics Institute (at Orsay) is presented. The purpose and evolution of research fields are summarized. The following topics are presented: in experimental research, nuclear structure, ground states and low energy excited states, high excitation energy nuclear states, heavy ion collision phenomena, intermediate energy nuclear physics, radiochemistry of lanthanides and actinides and heavy ion interactions material and surface; in theoretical physics, nuclear structure and dynamics, particle physics, field theory, statistical physics, variational principles and quantization of chaotic systems and mathematical methods. The Nuclear Physics Institute works also on the development of several multidetectors (EUROGAM, INDRA, EDEN) and accelerators (AGOR, MACSE, Tandem).

1991 (CONF-860158–9) **High spin states in ^{183,184}Pt.** Carpenter, M.P. (Tennessee Univ., Knoxville, TN (United States)); Bingham, C.R.; Courtney, L.H.; Juutinen, S.; Larabee, A.J.; Liu, Z.M.; Riedinger, L.L.; Zhang, Z.Y.; Johnson, A.; Nyberg, J.; Baktash, C.; Halbert, M.L.; Johnson, N.R.; Lee, I.Y.; Schutz, Y.Tennessee Univ., Knoxville, TN (United States). [1986]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AS05-76ER04936. From International meeting on nuclear physics; Bormio (Italy); 20-25 Jan 1986. Order Number DE93000582. Source: OSTI; NTIS; GPO Dep.

Data on discrete high spin states in ^{183,184}Pt is presented. In ^{184}Pt an upbend at a rotational frequency of $\hbar\omega \approx 0.25$ MeV is interpreted as an alignment of two $h_{9/2}$ quasiprotons and two $i_{13/2}$ quasineutrons occurring at about the same frequency. The structure of the high spin states in ^{183}Pt, observed for the first time in this experiment, reveal a significant signature splitting in the $\nu i_{13/2}$ band. In this transitional region of nuclei both triaxility and hexadecapole deformations may play a role in affecting the signature splitting.

1992 (CONF-9110289–5) **Rotational band structure of intruder configurations: success and limitations of the Cranked Shell Model.** Wyss, R. Joint Inst. for Heavy Ion Research, Oak Ridge, TN (United States). [1991]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;FG05-87ER40361. From International symposium on reflections and directions in low energy heavy ion physics; Oak Ridge, TN (United States); 14-15 Oct 1991. Order Number DE93001713. Source: OSTI; NTIS; INIS; GPO Dep.

Rotational bands built on intruder configurations are discussed within the Cranked Shell Model. The experimental observed alignment pattern occurring in these bands cannot be accounted for by standard mean field calculations. The discrepancy between theory and experiment is traced back to the fact that the neutron-proton interaction is only partly and indirectly included in the standard mean field approach.

1993 (CONF-9205108–2) **Low-spin identical bands in odd-A nuclei.** Baktash, C.; Garrett, J.D.; Winchell, D.F.; Smith, A. Oak Ridge National Lab., TN (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International conference on nuclear structure at high angular momentum; Ottawa (Canada); 18-21 May 1992. Order Number DE92041016. Source: OSTI; NTIS; INIS; GPO Dep.

A comprehensive study of odd-A rotational bands in normally-deformed rare-earth nuclei indicates that a large number of seniority-one configurations (30% for odd-Z nuclei) at low spin have moments of inertia nearly identical to that of the seniority-zero configuration of the neighboring even-even nucleus with one less nucleon. It is difficult to reconcile these results with conventional models, based on the traditional picture of nuclear pair correlation in vogue for more than three decades, which predict variations of about 15% in the moments of inertia of configurations differing by one unit in seniority.

1994 (DOE/ER/40417–9) **Nuclear structure research: Progress report, August 1, 1991–July 31, 1992.** Brenner, D.S. Clark Univ., Worcester, MA (United States). Jul 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER40417 ;AC02-76CH00016. Order Number DE93000405. Source: OSTI; NTIS; INIS; GPO Dep.

The Clark University research program in nuclear structure is a collaborative effort involving Clark University personnel, staff members from Brookhaven National Laboratory and an active participation of scientists from other nations. The TRISTAN on-line isotope separator and the capture γ-ray facility at the HFBR are the experimental foci of the program which has four principal research themes, three involving nuclear structure physics and one directed towards astrophysics. These themes are: (1) the manifestation of the proton-neutron interaction in the evolution of nuclear structure and its relation to collectivity, (2) the appearance and the role of symmetries and supersymmetries in nuclei, (3) the study of new regions of magic nuclei, and (4) the characterization of nuclei important in r-process stellar nucleosynthesis. The activities involving Clark personnel during the operating period of Grant No. FG02-88ER40417, August 1, 1991–July 31, 1992, are summarized.

1995 (DOE/ER/40561–75) **Semi-empirical mass formula for drops of strange matter and constrains from recent experiments.** Desai, M.S. (Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory); Shaw, G.L.; Crawford, H.J. Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory. [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER40561 ;AC03-76SF00098. Order Number DE92040074. Source: OSTI; NTIS; INIS; GPO Dep.

Fixed-target experiments with relativistic heavy-ion collisons at BNL and CERN search for small metastable drops of strange matter, S drops. A useful semi-empirical mass formula for S drops is presented here. This mass formula can easily be fitted to the experimental results. The results of an experiment at BNL are used to constrain the parameters.

This report discusses the following topics: fundamental symmetries in the nucleus; internucleon interactions; internucleon dynamics in very light nuclei; the many-nucleon problem; developments in electronuclear physics; and nuclear instruments and methods.

1997 (IN2P3–92-01) **Nuclei in high forms.** Szymanski, Z.; Berger, J.F.; Heenen, P.H.; Heyde, K.; Haas, B.; Janssens, R.; Paya, D.; Gogny, D.; Huber, G.; Bjoernholm, S.; Brack, M. Institut National de Physique Nucleaire et de Physique des Particules (IN2P3), 75 - Paris (France). 1991. 360p. (In French). (CONF-9109278–: International Joliot-Curie summer school of nuclear physics, Maubuissen (France), 16-21 Sep 1991). Order Number DE93720936. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of 1991 Joliot-Curie Summer School is to review the most advances in the understanding of the nuclei physics after the considerable progress in gamma spectroscopy. It covers the following topics: Highly and super-deformed nuclei, nuclear structures, mean-field approach and beyond, fission isomers, nuclear excitations with long lifetime and metal clusters.

1998 (INIS-BR–2934, pp. 306-312) **Separable potentials and the delta-nucleon interaction.** Ferreira, E. (Pontificia Univ. Catolica do Rio de Janeiro, RJ (Brazil). Dept. de Fisica); Dosch, H.G. Sociedade Brasileira de Fisica, Rio de Janeiro, RJ (Brazil). 1989. 350p. (CONF-8909489–: 10. National Meeting on Physics of Particles and Fields, Itatiaia (Brazil), 20-24 Sep 1989). In *Proceedings of the 10. National Meeting on Physics of Particles and Fields.* Order Number DE93604123. Source: OSTI; NTIS (US Sales Only); INIS.

We obtain rank-one separable potentials with Yamaguchi form factors to describe the ΔN isospin one $^5S_2$ and $^5P_3$ phases which were obtained from the analysis of πd elastic scattering observables. For both waves the separable potentials are attractive, but not strong enough to form bound states, and present range parameters of the order of three times the pion mass. (author).

1999 (IPNO-T–91-07) **Form coexistence in ^{187}Au: study of the populations of oblate and prolate systems.** Korichi, A. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 15 May 1991. 93p. (In French). Order Number DE93721700. Source: OSTI; NTIS (US Sales Only); INIS.

The study of the high-spin states of ^{187}Au shows, for the first time, that the population of the prolate and the oblate systems depends of the reaction and the beam energy. The first experiment of this work was carried out using the ^{160}Gd(^{31}P, 4n) reaction at 145 MeV. This one should bring more angular momentum and then populate higher spin states in comparison with those populated using the ^{172}Yb(^{19}F, 4n) at 95 MeV (up to 57/2h). All these studies were carried out with in beam spectroscopic techniques using the 'Chateau de Cristal' array. No higher spin states were observed in the ^{31}P reaction, however the analysis of the γ-γ coincidences revealed a difference between the population of the prolate and the oblate bands as compared in the ^{19}F reaction. Measurements of the population of prolate and oblate states at different beam energies for both F and P projectiles have been undertaken. The fission cross section has been measured for these two systems at the same energies to see whether or not the fission plays a role. In the other hand, theoretical calculations using the cracking model have been done and the results of these calculations showed that the shape coexistence survives up to spin 40h.

2000 (IPNO-T–92-01) **One nucleon transfer reactions induced by heavy ions: single particles states and collective modes.** Lhenry, I. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Apr 1992. 147p. (In French). Order Number DE93721023. Source: OSTI; NTIS (US Sales Only); INIS.

In one nucleon transfer reactions induced by heavy ion beams, broad and very prominent structures are observed above 10 MeV excitation energy. The aim of this work is to try to understand these structures and to distinguish between interpretations in terms of the excitation of single particles states or collective modes such as giant resonances. We studied one nucleon transfer reactions on different targets ^{207}Pb, ^{209}Bi, ^{59}Co, ^{63}Cu, ^{58}Ni, ^{120}Sn with beams of ^{20}Ne at 48 MeV/A and of ^{36}Ar at 42 MeV/A, detecting reaction products with a magnetic spectrometer, in order to verify the presence of those structures and to measure them in broad range of reactions. The different experimental results show that these bumps cannot be attributed to low multipolarity giant resonances (L=1 or 2). These results have been compared with two very different theoretical approaches. The first one uses a reaction model in order to evaluate the cross section of the different processes that can contribute to the transfer spectra. The second one is based on a microscopic description of the excited states in the random phase approximation (RPA), followed by a cross section calculation in the distorted wave Born approximation (DWBA). In the framework of these models, it appears that the observed structures are dominated by the excitation of high spin single particle states. Nevertheless, a small part of the cross section can be attributed to collective excitations of high multipolarity.

2001 (JINR-E–1-90-591) **Study of relativistic hypernuclei produced in nucleus-nucleus interactions.** Okonov, Eh.O. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1990. 6p. Order Number DE93606143. Source: OSTI; NTIS (US Sales Only); INIS.

The experiment is proposed to study relativistic hypernuclei produced in nucleus-nucleus interactions using the spectrometer with fast coordinate and charge detectors. The main points of the proposed experimental programm in nuclear beams of the nuclotron are briefly outlined: observation and study of unknown hypernuclei with charge $Z>6$, measurements of their decay lifetimes, investigations of characteristics of their decays as a function of Z, a search for new hypernuclei with strangeness $S\geq 2$ and strange multiquark states as well. 13 refs.; 1 fig.

2002 (JINR-R–2-91-348) **Shell structure calculation method in eikonal theory.** Omboo, Z.; Ehnkhbat, S. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 6p. (In Russian). Order Number DE93606151. Source: OSTI; NTIS (US Sales Only); INIS.

The problem of calculating cross-sections for particle-nucleus interactions is considered in the framework of eikonal approach. In the case of antisymmetrized oscillator functions, the method is developed. Simplifying conditions for calculation of determinants are found. 5 refs.; 1 fig.

2003 (JINR-R–11-91-351) **On a calculation of complex energies of the resonance states.** Zhanlav, T.; Puzynin, I.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. 10p. (In Russian). Order Number DE93606150. Source: OSTI; NTIS (US Sales Only); INIS.

The problem of calculation of the resonance states in spherical nuclei is formulated as an eigenvalue one. Two ways of defining a

boundary condition at infinity for a wavefunction are suggested. For solving numerically the obtained eigenvalue problem a modification of the continuous analog of Newton's method is used which allows the resonance energy and wavefunction to be found to a high accuracy. 18 refs.; 1 tab.

2004 (LA-UR–92-3199) **Application of multistep compound and multistep direct models for data evaluation.** Chadwick, M.B.; Young, P.G. Los Alamos National Lab., NM (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-921046–1: Symposium on nuclear data evaluation methodology, Upton, NY (United States), 12-16 Oct 1992). Order Number DE93000865. Source: OSTI; NTIS; INIS; GPO Dep.

We have implemented the quantum mechanical multistep compound (MSC) and multistep direct (MSD) theories of Feshbach, Kerman, and Koonin (FKK) for the calculation of nucleon-induced multistep reactions. Our code system, FKK-GNASH, uses the FKK theory for primary preequilibrium emission and describes subsequent equilibrium emission using the Hauser-Feshbach code GNASH. The MSC contribution yields emitted particles with angular distributions symmetric about ninety degrees, whereas the MSD contribution, calculated by averaging DWBA cross sections for particle-hole excitations in the continuum, results in forward-peaked preequilibrium emission. The original picture of the evolution of the reaction, as described by FKK, is modified to allow transitions from the MSD to MSC chain. This modification is consistent with semiclassical preequilibrium descriptions, and allows a good description of preequilibrium spectra and angular distributions for a range of different reactions. As an example of our methodology, we calculate ^{93}Nb(n,n') reactions at 14, 20 and 26 MeV, and ^{93}Nb(n,p) at 14 MeV, comparing our results with experimental data. Use of the FKK theory has the advantage that preequilibrium calculations are based on rigorous physical principles, and (unlike semiclassical approaches) allow a good description of angular distributions. We argue that our implementation of the FKK theory maximizes the level of predictability, which is needed for data evaluations.

2005 (LBL–32497) **Tilted cranking classification of multibandspectra.** Frauendorf, S. (IHK FZ-Rossendorf, Dresden (Germany)); May, F.R. Lawrence Berkeley Lab., CA (United States). 19 Jun 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9205108–15: International conference on nuclear structure at high angular momentum, Ottawa (Canada), 18-21 May 1992). Order Number DE92041187. Source: OSTI; NTIS; INIS; GPO Dep.

The existence of TDHF-solutions rotating uniformly about a non-principal axis of the deformed axial potential is demonstrated. The solutions represent $\Delta I=1$ bands. Selfconsistency and symmetry are discussed. The transformation of experimental spectra to the rotating frame of reference is introduced. Excitation spectra at high spin are calculated and found to agree well with recent data on ^{163}Er and ^{174}Hf.

2006 (LIYaF–1655) **Construction of the wave function of tritium/helium-3 using a method based on the extraction of leading singularities.** Anisovich, A.V.; Anisovich, V.V. AN SSSR, Leningrad (Russian Federation). Inst. Yademoj Fiziki. 1990. 23p. Order Number DE93606144. Source: OSTI; NTIS (US Sales Only); INIS.

In the framework of dispersion presentation of the Faddeev equation a method for plotting wave function of three-particle bound state is suggested. Wave function of tritium/helium-3 with approximation of NN interaction by S wave amplitudes in scattering length approximation was found. Form factor of helium-3 was calculated, its value being in a good agreement with experimental data at $q^2<2$ fm^{-2}. 8 refs.; 6 figs.

2007 (SINS–2106/A, pp. 41-46) **Superdeformed structures in the ^{143,145}Gd isotopes.** OSIRIS-Collaboration, ESSA 30-Collaboration. Institute of Atomic Energy, Otwock-Swierk (Poland). Nov 1990. (CONF-900857–: 21. Mikolajki summer school on nuclear physics: nuclear and atomic physics with accelerators of the nineties, Mikolajki (Poland), 26 Aug - 5 sep 1990). In *Nuclear and atomic physics with the accelerators of the nineties: Proceedings of the 21st Mikolajki summer school on nuclear physics, held in Mikolajki, Poland, August 26 - September 5, 1990. Seminars.* 111p. Order Number DE93604421. Source: OSTI; NTIS (US Sales Only); INIS.

We established a discrete superdeformed (SD) band in Gd consisting of 13 transitions with a quadrupole moment of $Q_0 = 12\pm2$ eb. Indications for the least two additional sequences of SD structure have been observed. We have shown that the triples analysis is a very powerful and sensitive method to detect SD collective correlations in nuclei. We have also shown, that we are approaching the limits of our present day technology. We have to sharpen our spectroscopic tools to be able to explore this new exciting field of nuclear spectroscopy in secondary minima. (author).

2008 (SINS–2106/A, pp. 47-52) **Structure of odd-odd Sb and In nuclei.** Fenyes, T. (Institute of Nuclear Research of the Hungarian Academy of Sciences, Debrecen (Hungary)); Dombradi, Zs.; Gacsi, Z. Institute of Atomic Energy, Otwock-Swierk (Poland). Nov 1990. (CONF-900857–: 21. Seminars.* 111p. Order Number DE93604421. Source: OSTI; NTIS (US Sales Only); INIS.

The level structure of $^{118, 116}$Sb and $^{114, 112, 110}$In, $^{108, 106}$In nuclei was studied with complex γ- and e^- -spectroscopic methods via (p, nγ) and in some cases (α, nγ) reactions at different bombarding particle energies between 5 and 17 MeV. Large amount of spectroscopic information has been obtained and significantly extended level schemes have been deduced. The energy spectra and electromagnetic properties of ^{116}Sb, $^{116, 114, 112, 110, 108, 106}$In nuclei were calculated in the framework of the interacting boson-fermion-fermion/odd-odd truncated quadrupole phonon model (IBFFM/OTQM). Numerous p-n multiplet members have been identified. The main systematic trends and observed nuclear structure anomalies have been reasonably described by the theory. (author).

2009 (SINS–2106/A, pp. 58-62) **High spin states in ^{131}Ce.** Palacz, M. A comparison of the O(6)-limit of the Interacting Boson Model and of the triaxial rotor model with β-vibration has been carried out for the nucleus ^{126}Xe. The comparison has been extended to include the Rotation Vibration model. In conclusion it was found that the O_2^+ and 2_2^+ states in transitional nuclei can not be interpreted as β-and γ-band heads respectively. (author).

DOE Contract W-7405-ENG-48 ;AC03-76SF00098. (CONF-920708–5: 2. international nuclear physics conference, Wiesbaden (Germany), 26 Jul - 1 aug 1992). Order Number DE93001303. Source: OSTI; NTIS; INIS; GPO Dep.

Evidence for collective behavior in the high-spin region of neutron deficient lead nuclei is provided by the observation of four collective structures in ^{197,198}Pb. These bands consist of strong dipole (M1) transitions with a few E2 crossover transitions observed. The transition energies of three of these bands show a rather regular behavior while those of one of them show an irregular behavior. We interpret the regular bands as oblate collective bands built on oblate proton and neutron states, whereas the irregular band might either be built on a state with very small oblate deformation, or be a triaxial rotational band. A lifetime measurement (DSAM) has been done for the regular bands in ^{198}Pb. Neutron and proton configurations for the bands are suggested from the results of quasi particle Routhians and total Routhian surface (TRS) calculations.

The alpha decay of $^{181--186}$Au and $^{181--185}$Pt has been studied utilizing sources from an on-line isotope separator. The α decay of ^{185}Pt and ^{186}Au was observed for the first time and several new α groups were observed for the decay of $^{181--185}$Au. By simultaneous measurement of γ-rays and x-rays and use of known ec/β+ decay schemes, α-decay branching ratios and hindrance factors were deduced for each α transition. Several previously unknown low-lying γ-ray transitions were observed in the Ir daughters by means of α-γ coincidence measurements.

A new picosecond lifetime measurement system developed at UNISOR was used to determine the lifetime of the well-deformed 0_2^+ levels in ^{188}Hg and ^{186}Hg. The half-life values were measured to be 288 $\pm$ 63 ps in ^{188}Hg and $\leq$ 52 ps in ^{186}HG. The corresponding values of $p^2(E0) \times 10^3$ obtained from the E0 partial half-lives are $5.5_{-2.3}^{+1.5}$ and $\geq$ 32, respectively. Additionally, the half-lives of the 2_2^+ levels were determined to be 199 $\pm$ 44 ps in ^{188}Hg and 66 $\pm$ 37 ps in ^{186}Hg.

The cross sections and rates of Coulomb deexcitation of muonic hydrogen are calculated with electron screening taken into account. Results without electron screening are also calculated for comparison. It is shown that for high excited states of muonic hydrogen Coulomb deexcitation plays an important role and should be taken into account together with other deexcitation processes. (author).

2019 (IPNO-T–91-04) **Half-life and delayed neutron emission probabilities measurement of ^{44}S,$^{45-47}$Cl spectrometer: their implication in the ^{48}Ca/^{46}Ca ratio understanding in the solar system.** Sorlin, O. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire; Paris-7 Univ., 75 (France). Jun 1991. 104p.

(In French). Order Number DE93721031. Source: OSTI; NTIS (US Sales Only); INIS.

After a detailed description of the simulation program LISE, experimental measurements of the radioactive decay (half-lives and neutron delayed emission probabilities) of the neutron rich nuclei ^{44}S, ^{45}Cl, ^{47}Cl are presented. The comparison between these results and the theoretical predictions clearly shows that mass and deformation measurements of these nuclei are very important to determine precisely the radioactive decay parameters necessary to astrophysics. Effectively, these ones are used in star evolution models to understand the elements abundance curve of the solar system. Even if the shape of this curve is well reproduced, some anomalies subsist. The experimental results seem to show that, with the constraints they bring, a double r process in low-mass supernovae of type II can explain twice the isotopic anomalies and the shape of the elements abundance curve.

2020 (IPNO-T–91-06) **Band structure in Platinum nuclei (A ≈ 182).** Popescu, D.G. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 3 Dec 1991. 173p. (In French). Order Number DE93721701. Source: OSTI; NTIS (US Sales Only); INIS.

In this thesis, the author studies the band structure in Platinum nuclei and has divided his work in 5 parts: in the first, the author makes a general presentation of nucleus physics with a high angular momentum and introduces to the deformed nucleus notion -axial, triaxial or mixing of different deformations. The notion of form co-existence will be used to interpret the experimental results. In the second part, the author describes the detection means which have been used to make measurements. An abstract of theoretical notions, usefull for the understanding of fusion-evaporation reaction is presented. The author explains the details, performances and different modes of using of 'Chateau de cristal' and others used spectrometers. In the third part, the author presents all experimental data. He has effected γ coincidence measurements for Pt, Au and Ir nuclei. In the fourth part, for a classical analysis or an interpretation in the frame of cranking model the author presents theoretical models which are adapted at the study of high spin states and band structures.

We propose a new, model independent method which can be used to analyse high quality data from inelastic scattering or charge exchange reactions. Such data contain resonances observed as bumps superimposed on a smooth continuum generally assumed to the background. The major problem in these studies is the decomposition of data into bumps originating from nuclear excitations and the underlying continuum. (author).

2028 (DOE/ER/40269–14) **Nuclear Physics Laboratory technical progress report, [August 15, 1991–October 1, 1992].** Colorado Univ., Boulder, CO (United States). Nuclear Physics Lab. 1 Oct 1992. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER40269 ;FG02-87ER40335. Order Number DE93001614. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes work carried out between August 15, 1991 and October 1, 1992 at the Nuclear Physics Laboratory of the University of Colorado, Boulder, under contracts DE-FG02-86ER-40269 and DE-FG02-87ER-40335 with the United States Department of Energy. These contracts support experimental and theoretical work in intermediate energy nuclear physics. The experimental program is very broadly based; it includes pion-nucleon and pion-nucleus studies at Los Alamos and TRIUMF inelastic pion scattering and charge exchange reactions at LAMPF, kaon-nucleus scattering at the AGS, and nucleon charge exchange at LAMPF/NTOF.

Source: OSTI; NTIS; INIS; GPO Dep.

Our work involves the study of intermediate energy heavy-ion nuclear reactions. This work has two foci. On the one hand, we desire to learn about the properties of nuclear matter under abnormal conditions, in this energy domain, predominately low densities. This purpose runs abreast of the second, which is the study of the relevant reaction mechanisms. The two objectives are inexorably linked because our experimental laboratory for studying nuclear matter properties is a dynamic one. We are forced to ask how nuclear matter properties, such as phase transitions, are reflected in the dynamics of the reactions. It may be that irrefutable information about nuclear matter will not be extracted from the reaction work. Nevertheless, we are compelled to undertake this effort not only because it is the only game in town and as yet we do not know that information cannot be extracted, but also because of our second objective. The process leads to an understanding of the reaction mechanism themselves and therefore to the response characteristics of finite, perhaps non-equilibrium, strongly interacting systems. Our program has been: To study energy, mass, and angular momentum deposition by studying incomplete fusion reactions. To gain confidence that we understand how highly excited systems decompose by studying all emissions from the highly excited systems. To push these kinds of studies into the intermediate energy domain, with excitation function studies. And attempt to learn about the dynamics of the decays using particle-particle correlations. In the last effort, we have decided to focus on simple systems, where we believe, definitive statements are possible. These avenues of research share a common theme, large complex fragment production.

2032 (GANIL-A–92-02) **Charge exchange of very heavy ions in carbon foils and in the residual gas of the Ganil cyclotrons.** Baron, E.; Bajard, M.; Ricaud, C. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1992. 5p. (CONF-9206299–: 6. Conference on Electrostatic Accelerators and Associated Boosters, Padova (Italy), 1-5 Jun 1992). Order Number DE93721017. Source: OSTI; NTIS (US Sales Only); INIS.

The results of several years of operation with heavy to very heavy ions in the GANIL accelerators, along with specific measurements concerning stripping through carbon foils, led to a set of valuable recipes for predicting the characteristics required to obtain a desired charge state distribution. The ion species under study range from Ar to U and the energies from 3.8 to 10.6 MeV/nucleon. The experimental method and the fits of the results are presented. A series of measurements was also set up to evaluate the beam losses during acceleration in the three cyclotrons; with the help of existing models for charge exchange cross-sections, it is shown that vacuum requirements can be fairly accurately determined. 7 tabs.

2033 (IC–92/151) **Theory of deep-inelastic scattering reactions and x-rescaling model.** Kaptari, L.P. (International Centre for Theoretical Physics, Trieste (Italy)); Umnikov, A.Yu. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 21p. Order Number DE93604519. Source: OSTI; NTIS (US Sales Only); INIS.

A novel point of view on the x-rescaling model in leptons-nucleus deep inelastic scattering is suggested. Using the operator product expansion method within the effective meson-nucleon theory, we present a rigorous consideration of the scattering on the deuteron. We demonstrate that with the contributions interpreted as the Fermi motion and mesonic corrections, the x-rescaling idea is exactly reproduced. The diagrams of the scattering off bound nucleons have also been computed numerically. It is shown that taking into account the nuclear effects viz. shadowing and meson exchange currents the experimental behavior of the ratio of deuteron and nucleon structure functions as $x \rightarrow 0$ is explained. The Gottfried integral is estimated as well. (author). 26 refs, 5 figs.

2039 (ISN-92-31) **Study of evolution of $^{40}Ar+^{nat}Ag$ reaction from 7 to 34 MeV/u with a 4π multidetector of charged particles.** Ethvignot, T. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. Mar 1992. 132p. (In French). Order Number DE93721025. Source: OSTI; NTIS (US Sales Only); INIS.

Properties of hot nuclei have been studied in the reactions of ^{40}Ar with ^{nat}Ag at 7, 17, 27 and 34 MeV with AMPHORA, a 4π multidetector for charged particles. For central collisions, the results support the classical picture of hot (E* as great as 5 MeV/Nucleon), heavy (M $\approx$ 100-130 amu) nuclear systems, with high spin ($J_{max} \geq 100h/2\pi$) that emit a long chain of particles and fragments. Out-of-plane fragment production increases strongly with incident energy. This suggests that symmetric fission gradually disappears, as three or more body breakup processes become preferred modes of decay. Furthermore, the fragment-fragment correlations seem to indicate that Li fragments are emitted rapidly ($\tau \leq 10^{-21}$s) and often before the protons and α particles. This implies that thermalization of the composite nucleus is so fast that it clouds a clear signal for the hypothesis of 'instantaneous' multifragmentation.

2040 (JINR-E-1-91-511) **The study of reactions with deuteron and pions in the final state by np- and dp-interactions comparison.** Glagolev, V.V. (and others); Troyan, Yu.A.; Lebedev, R.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1991. 24p. Order Number DE93606160. Source: OSTI; NTIS (US Sales Only); INIS.

Characteristics of dp-$d\pi^+$n, dp->$dp\pi^+\pi^-$ and np->$d\pi^+\pi^-$ reactions at 1.7 GeV/c/nucleon obtained by working up the films from 1-m hydrogen bubble chamber JINR were studied. By the comparison of dp- and np-interactions the coherent production of π on deuteron and baryon exchange processes were separated in deuteron reactions. 18 refs.; 12 figs.; 2 tabs.

2041 (JINR-E-4-91-336) **Off-shell form factors in the soft photon limit for pion photoproduction.** Chumbalov, A.A. (AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki); Kamalov, S.S. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 4p. Order Number DE93606161. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Phys. Lett., B.

The low energy theorems for the pion photoproduction are considered on the basis of the Adler-Dothan procedure. It is shown that the soft photon limit necessarily leads to the Born approximation for the π^0-photoproduction amplitude at the threshold. All additional terms, according to the Adler-Dothan recipe, are to be neglected in the derivation of the LET. 5 refs.; 2 figs.

2042 (JINR-E-15-91-411) **Studies of formation of fusion evaporation residues with Z$\geq$83 in heavy ion reactions.** Andreev, A.N. (and others); Bogdanov, D.D.; Chepigin, V.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions. 1991. 14p. Order Number DE93606172. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Intern. Symposium Nikko 91, 'Toward a Unified Picture of Nuclear Dynamics', Japan, 6-8 June, 1991.

By employing the kinematic separator VASSILISSA and the beams of $^{20,22}Ne$, $^{24,26}Mg$, ^{40}Ar and ^{40}Ca 18 projectile-target combinations leading to formation of compound nuclei with atomic numbers 83-102 and obtained xn, pxn and axn evaporation residues in the range of the projectile energy extending from the Coulomb barrier to the values corresponding to the compound nucleus excitation of about 100 MeV are studied. The systematics is presented of the maximum xn reaction cross-sections which are governed by the fissility of the reaction products. As a result, the values of macroscopic fission barriers were extracted for the neutron-deficient nuclides in the range of Z=83-92 and N=104-134. 43 refs.; 9 figs.; 5 tabs.

2043 (JINR-R-1-90-584) **Total breakup of ^{3}He and ^{4}He nuclei in interactions with protons.** Glagolev, V.V. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Lebedev, R.M.; Pestova, G.D. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1990. 11p. (In Russian). Order Number DE93606171. Source: OSTI; NTIS (US Sales Only); INIS.

The experiment has been performed on the JINR synchrotron by means of the 100-cm liquid-hydrogen chamber. The total cross sections of the nonmesonic breakup reactions of ^{3}He and ^{4}He nuclei are determined. The analysis of the nuclear reaction is carried out. It is shown that the total nonmesonic ^{3}He nuclei breakup occurs mainly as a result of the proton quasi-elastic scattering on one of the nucleon of the nucleus, whereas the total nonmesonic ^{4}He-breakup - principally in the double proton scattering with the nucleons of the nucleus. 11 refs.; 6 figs.; 4 tabs.

2044 (JINR-R-1-91-85) **The production of two multicharged fragments in fragmentation of ^{28}Si on photoemulsion nuclei.** Vokal, S. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Shabratova, G.S.; Avetyan, F.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1991. 6p. (In Russian). Order Number DE93606173. Source: OSTI; NTIS (US Sales Only); INIS.

Experimental data on ^{28}Si relativistic nuclei fragmentation in interactions with photoemulsion nuclei are given. The charge characteristics of fragments, their pair azimuthal angle distributions and momentum spectra in the events with two multicharged fragments have been obtained. The comparison with the percolation model has been performed. 7 refs.; 6 figs.; 2 tabs.

2045 (JINR-R-1-91-439) **The measurement of the differential cross section in the double quasi-elastic proton scattering on ^{12}C at the energy of (660+-7) MeV.** Budyashov, Yu.G.; Nadezhdin, V.S.; Petrov, N.I.; Satarov, V.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 4p. (In Russian). Order Number DE93606165. Source: OSTI; NTIS (US Sales Only); INIS.

The reaction of direct knock-out of proton pairs from ^{12}C nuclei at 660 MeV was investigated with a three-arm spark spectrometer in conditions when the main contribution to the reaction gives the mechanism of the double quasi-elastic scattering. The differential cross section of the reaction is measured. 5 refs.; 3 figs.

Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 20p. (In Russian). Order Number DE93606164. Source: OSTI; NTIS (US Sales Only); INIS.

The experimental method of angular correlation measurement in nuclear capture muons is described. The results of two test experiments with a silicon target are presented. 23 refs.; 15 figs.; 1 tab.

2048 (LPCC-T–92-01) **Hot nuclei production in Ar+Ag reactions at 50 and 70 MeV/u: limits of decay standard mode.** Vient, E. Caen Univ., 14 (France). Lab. de Physique Corpusculaire. Apr 1992. 115p. (In French). Order Number DE93721016. Source: OSTI; NTIS (US Sales Only); INIS.

The experiment discussed in this thesis is devoted to the study of hot nuclei produced in the Ar + Ag collisions at 50 and 70 MeV per nucleon. Special emphasis has been given to the standard decay of these nuclei, i.e. to the sequential evaporation process leading to a heavy residue. The experimental set up has been triggered by a residue detector and all the evaporated light charged particles have been detected in a large area set up covering nearly the whole space. It has been possible to sort all the detected particles and to isolate those evaporated from the initial hot nuclei, the initial characteristics of which have been reconstructed. Two important features have been stressed: - A shot nuclei can sustain an excitation energy of 6 MeV/a and a temperature of 8 MeV without disintegrating completely. - The distributions of excitation energy stored at 50 and 70 MeV/nucleon are similar. This result can refled either an entrance channel property or a hot nuclei behaviour. Further results obtained in this work give arguments supporting the first interpretation.

2049 (LU-TP–92-12) **Diffractive J/Ψ-electroproduction in LLA QCD.** Ryskin, M.G. (Lund Univ. (Sweden). Dept. of Theoretical Physics and St. Petersbourg Nuclear Physics Inst. (Russian Federation)). Lund Univ. (Sweden). Dept. of Theoretical Physics. Mar 1992. 7p. Order Number DE93604504. Source: OSTI; NTIS; INIS.

Cross section of diffractive J/Ψ-production in deep inelastic scattering in the Born and the leading log approximations of perturbative QCD are calculated. (au).

2050 (PCCF-T–91-02) **Inclusive experimental study of dimuon production in proton-nucleus interactions at 450 GeV/c.** Fredj, L. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. Sep 1991. 171p. (In French). Order Number DE93721005. Source: OSTI; NTIS (US Sales Only); INIS.

The relative J/Ψ and Ψ suppression and Φ enhancement observed in the NA38 experiment may be explained by the formation of the quarks and gluons plasma and/or more classical phenomena. In the NA38 framework we study the production of dimuons using a direct proton beam at 450 GeV/c and a set of 4 targets (C, Al, Cu and W). For this work the apparatus has been modified in order to reduce the background and improve the mass resolution. Rigorous error propagation as well as the good statistics did allow us to retain the power law ($\sigma/A = A^{\alpha-1}$) of the production's parametrisation which is good agreement with our data instead of the linear law ($\sigma/A = k - k'A$). All the mass range between 0.5 and 5 GeV/c^2 has been explored, we give the α parameter of all processes in this range and the production ratio of a process X relatively to an other process Y where X is always sensitive to the Quagma formation, these ratios has been calculated in three different ways, all results are very coherent. Our results compatible with those published are more precise. We give also the partial cross sections and the experimental perspectives. 58 tabs., 61 figs.

2051 (PCCF-T–92-02) **Differential cross section study of fragment production, at small angle, in relativistic heavy ion collisions. Application at a calculation of heavy ion beam transport in the matter.** Morel, P. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. Feb 1992. 183p. (In French). Order Number DE93721007. Source: OSTI; NTIS (US Sales Only); INIS.

Relativistic heavy ion collisions present the opportunity of creating in laboratory small volumes of hot, dense nuclear matter. On the experimental point of view, the collision events are characterized by a great number of fragments, especially in the direction of the projectile. The first part is devoted to a survey of relativistic heavy ion physics. Then, we present two experimental set-ups which permit, in particular, the analyse of light fragment production at small angles. We present experimental results concerning light projectiles on Ca, Nb, Pb targets, with energies from 200 A.MeV up to 600 A.MeV. Different aspects of the collision are put in evidence. Momentum and charge differential cross section are extrapolated to other projectile/target systems; that is used in a transport calculation of Ne ions in a target of biological interest (water), with a collimator. We show that nuclear fragmentation produces a dispersion in the spatial and energy distributions, and that one light fragments have a range greater than the projectile range. That last point causes a distortion of the Bragg curve, and that distortion must be taken into account for the application of heavy ions to radiotherapy problems. 95 figs., 8 tabs.

2052 (SINS–2106/A, pp. 12-14) **Competition between pn and d emission in α + ^{51}V, ^{54}Fe reactions at 26.5 MeV.** Bednarczyk, P. (Institute of Nuclear Physics, Cracow (Poland)); Bozek, E.; Fornal, B.; Lach, M.; Maj, A.; Meczynski, W.; Pawlat, T.; Styczen, J. Institute of Atomic Energy, Otwock-Swierk (Poland). Nov 1990. 2056 (AECL–10056) **Analytic scattering kernels for neutron thermalization studies.** Sears, V.F. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Jan 1990. 40p. Order Number DE93604590. Source: OSTI; NTIS (US Sales Only); INIS.

Current plans call for the inclusion of a liquid hydrogen or deuterium cold source in the NRU replacement vessel. This report is part of an ongoing study of neutron thermalization in such a cold source. Here, we develop a simple analytical model for the scattering kernel of monatomic and diatomic liquids. We also present the results of extensive numerical calculations based on this model for liquid hydrogen, liquid deuterium, and mixtures of the two. These calculations demonstrate the dependence of the scattering kernel on the incident and scattered-neutron energies, the behavior near rotational thresholds, the dependence on the centre-of-mass pair correlations, the dependence on the ortho concentration, and the dependence on the deuterium concentration in H_2/D_2 mixtures. The total scattering cross sections are also calculated and compared with available experimental results.

2057 (FEI–2080) **Invariance of solution of transport equations in closed subregion on surface sources of specific class.** Korobejnikov, V.V.; Usanov, V.I. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1990. 19p. (In Russian). Order Number DE93606179. Source: OSTI; NTIS (US Sales Only); INIS.

Invariance of solution of heterogeneous transport equation inside a closed subregion using a surface source set on its boundary with arbitrary change in the subregion properties was proved. Beyond the subregion solution equals the difference of the initial and subsidiary problems. The theorem proved is illustrated by numerical and analytical examples. The field of its application is heterogeneous regions of protection and subcritical systems with sources. 7 refs.; 2 figs.; 2 tabs.

2058 (IAEA-R–5470-F) **Experimental measurements of total attenuation cross section and photoelectric cross section for Fe, Cu, Sn, Y, SiH_4 and Si in the X-ray energy range of 1,4 KeV - 29 KeV: Final report for the period 15 December 1988 - 14 May 1992.** Wang Dachun (Beijing Normal Univ., Beijing (China). Beijing Radiation Center). International Atomic Energy Agency, Vienna (Austria). Sep 1992. 29p. Order Number DE93606183. Source: OSTI; NTIS (US Sales Only); INIS.

With x-rays produced by photon exciting elemental and compounds targets, the mass attenuation coefficients have been systematically measured for Cu, Fe, Sn, Y, SiH_4 and Si in the x-ray energy range of 1.4 KeV to 29 KeV. The photoelectric cross sections have been obtained by subtracting thermal diffuse scattering and Compton scattering cross section from the measured total cross sections and compared with the theoretical results. Refs and tabs.

The influence of the binding effects on the calculation of the corrections to ground state hyperfine splitting in muonium and positronium is analyzed. Main attention is paid to the problem of cancelation of anomalously large contributions caused by the quasipotential behaviour in the infrared region. Advantages of the quasipotential approach based on the two-time Green function are discussed. 20 refs.; 2 figs.; 2 tabs.

Source: OSTI; NTIS (US Sales Only); INIS.

Deconvolution of atomic line profiles, recorded on PC interfaced recording Fabry-Perot spectrometer, into its Lorentzian and Gaussian component has been carried out. Effect of various parameters of hollow cathode discharge lamp (light source) such as discharge current, bath temperature and gas pressure on Lorentzian and Gaussian width has been studied. The value of the self-broadening coefficient for neon-neon atomic interaction for the transition $2p^54P\text{-}2P^53s$ (λ=3472.571 A) has been determined. (author). 15 refs., 6 figs., 4 tabs.

2074 (DOE/ER/14161–1) **Spectroscopic investigation of the vibrational quasi-continuum arising from internal rotation**

of a methyl group: Progress report, September 15, 1990–September 14, 1991. Hougen, J.T. National Inst. of Standards and Technology, Gaithersburg, MD (United States). Molecular Physics Div. [1991]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-90ER14161. Order Number DE92040509. Source: OSTI; NTIS; GPO Dep.

The goal of this project is to use spectroscopic techniques to investigate in detail phenomena involving the vibrational quasicontinuum in a simple physical system. Acetaldehyde was chosen for the study because: (1) methyl groups are known to be important promotors of intramolecular vibrational relaxation; (2) the internal rotation of a methyl group is an easily describable large-amplitude motion, which should retain its simple character even at high levels of excitation, and (3) the aldehyde carbonyl group offers the possibility of both vibrational and electronic probing. The present investigation of the ground electronic state has three parts: (1) understanding the "isolated" internal-rotation motion below, at, and above the top of the torsional barrier, (2) understanding in detail traditional vibrational fundamental and overtone states, and (3) understanding interactions involving states with multiquantum excitations of at least one of these two kinds of motion. Progress during the first nine months of this project will be described under these three headings.

2075 (IC–92/176) **On the acceptor-related photoluminescence spectra of GaAs quantum-wire microcrystals: A model calculation.** Oliveira, L.E. Order Number DE93606192. Source: OSTI; NTIS (US Sales Only); INIS.

The acceptor-related photoluminescence spectrum of a GaAs quantum-wire microcrystal is theoretically investigated via a model calculation within the effective-mass approximation, with the acceptor envelope wave functions and binding energies calculated through a variational procedure. Typical theoretical photoluminescence spectra show two peaks associated to transitions from the n = 1 conduction subband electron gas to acceptors at the on-center and on-edge positions in the wire in good agreement with the recent experimental results by Hirum et al. (Appl. Phys. Lett. 59, 431 (1991)). (author). 14 refs, 3 figs.

Electric discharge type atomic vaporizer is developed for the spectroscopic study on actinide elements. Laser induced fluorescence study on actinide elements is performed by using this high temperature type atomizer. For the effective photoionization of elements, copper vapor laser pumped dye laser and electron beam heating type atomic vaporizer are built and their characteristics are measured. In addition, resonance ionization mass spectroscopic analysis for lead sample as well as laser induced fluorescence study on uranium sample in solution phase is made. (Author).

We have performed a high resolution study of the satellite structure of K X-rays in Ta and U produced by energetic heavy ion bombardment. The experimental results are compared with theoretical predictions based on the semiclassical approximation. We discuss the importance of L subshell coupling, charge transfer from the L shell of the target to the K shell of the projectile, vacancy redistribution during the life time of the K hole's angular momentum coupling with the open shells. We find very good agreement between theory and experiment, nevertheless a small discrepancy in the vicinity of the diagram lines remains. (author).

The Kβ x-ray spectra of Mo, Pd and La bombarded by 28 MeV ^{4}He ions were measured with a transmission curved crystal spectrometer. M-shell ionization probabilities in central collisions were deduced from the M satellite lines of the Kβ_2 transitions. A comparison of the values obtained for Mo, Pd and La with theoretical (SCA) predictions demonstrates the importance of the recoil term. (author).

This report discusses the following topics: Summary of session on synergistic co-ordination of theory and experiment; synergism between experiment and theory in atomic physics; comparison of theory and experiment for electron-ion excitation and ionization; summary of session on new theoretical and computational methods; new theoretical and computational methods-r-matrix calculations; the coulomb three-body problem: a progress report; summary of session on needs and applications for electron-ion collisional data; electron-ion collisions in the plasma edge; needs and applications of theoretical data for electron impact excitation; summary of session on relativistic effects, indirect effects, resonance, etc; direct and resonant processes in electron-ion collisions; relativistic calculations of electron impact ionization and dielectronic recombination cross section for highly charged ions; electron-ion recombination in the close-coupling approximation; modified resonance amplitudes with strongly correlated channels; a density-matrix approach to the broadening of spectral lines by autoionization, radiative transitions and electron-ion collisions; towards a time-dependent description of electron-atom/ion collisions two electron systems; and comments

on inclusion of the generalized bright interaction in electron impact excitation of highly charged ions.

2081 (IC–92/147) **Excitation of atomic hydrogen.** Tiwary, S.N. (International Centre for Theoretical Physics, Trieste (Italy)); Singh, D.D. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 9p. Order Number DE93604639. Source: OSTI; NTIS (US Sales Only); INIS.

We have calculated the angular differential cross sections for the optically forbidden excitation $e^-+H(1s) \rightarrow e^-+H(2s)$ as well as the optically allowed excitation $e^-+H(1s) \rightarrow e^-+H(2p)$ transitions in the hydrogen atomic system by electron impact using the basic functions (1s-2s-2p) within the R-matrix method. Comparison is made with experimental and theoretical results. (author). 33 refs, 1 fig.

2082 (IC–92/148) **Oscillator strengths for P V, S VI, Cl VII, Ar VIII and K IX.** Tiwary, S.N. (International Centre for Theoretical Physics, Trieste (Italy)); Kumar, M.; Singh, D.D.; Kumar, P. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 14p. Order Number DE93604640. Source: OSTI; NTIS (US Sales Only); INIS.

Optical oscillator strengths, of both the length and velocity forms, for the inner-shell excitation $1s^22s^22p^63s\ ^2S^e \rightarrow 1s^22s^22p^53s^2\ ^2P^o$ transition, which leads to autoionization (Auger transition) in P V, S VI, Cl VII, Ar VIII and K IX ions of the sodium isoelectronic sequence have been calculated using the approach suggested by one of the authors (Tiwary) in the case of Fe XVI ion. Our present calculated results demonstrate that the Tiwary approach is capable of yielding encouraging results. (author). 22 refs, 11 tabs.

2083 (JINR-R–4-91-129) **The yield of resonances in the He(e, 2e)He$^+$ reaction depending on the ejection angle.** Lkhagva, O.; Strakhova, S.I.; Badamdamdin, R.; Khehnmehdehkh, L. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 14p. (In Russian). Order Number DE93606205. Source: OSTI; NTIS (US Sales Only); INIS.

In the first Born approximation the interference and relation of the yields of overlapping ^1P and ^1D autoionization states (AIS) in the He(e,2e)He$^+$ reaction in the dependence on the ejection angle in a wide region of kinematic variables are considered. It is shown that in the quasi-elastic peak region there exists a region of ejection angles for which at certain kinematic situations the resonance contributions of the ^1P and ^1D AIS lead to the complicated asymmetric structure in the spectrum triple differential oscillator strengths. In the recoil peak these resonances, as a rule, are fairly isolated and the relation of their yields varies noticeably depending on kinetic variables. 17 refs.; 7 figs.; 1 tab.

2084 (LBL–32515) **Reaction dynamics and photochemistry of divalent systems.** Davis, H.F. Lawrence Berkeley Lab., CA (United States). May 1992. 311p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92041173. Source: OSTI; NTIS; GPO Dep.

Results are presented of molecular beam studies of bimolecular and unimolecular reactions of Ba. Chapter 1 discusses the reaction Ba + NO_2. Formation of the dominant $BaO(^1\Sigma)$ + NO products resulted primarily from decay of long-lived $Ba^+NO_2^-$ collision complexes. Secondary mechanisms led to formation of forward scattered, internally excited BaO, and BaNO + O. D_o(Ba-NO) = 65±20 kcal/mol. Reactions of ground state and electronically excited Ba with water and alcohols are examined in Chapter 2. Reaction of $Ba(^1S)$ + H^2O led to BaO + H_2, whereas excited state $Ba(^1D)$ + H_2O reacted to form BaOH + H. Collisions between Ba and CH_3OH led to $BaOCH_3$ + H. Radical channels involve H-atom migration and are promoted by excitation of the incident Ba atom. In Chapter 3, reactions of $Ba(^1S)$ with ClO_22 and O_3 are discussed. Again, direct and complex mechanisms were observed. Formation of BaCl + O_2 from decomposition of $Ba^+ClO_2^-$ accounted for 10% of total reaction crass section. Although Ba + O_3 → BaO + 0_2 occurs primarily by direct reaction mechanisms, the secondary channel Ba + 0_3 → BaO_2 + 0 involved decay of long lived $Ba^+O_3^-$ intermediates. $D_o(Ba-O_2)$ = 120 ±20 kcal/mol. Photodissociation dynamics of NO_3 is explored in chapter 4. Visible excitation leads to formation of NO + 0_2 and NO_2 + O. Wavelength dependence of branching ratios is investigated. D_o(O-NO_2) = 48.55 kcal/mole ;and calculate $\Delta H_f(NO_3)$ = 17.75 kcal/mole (298K). Chapter 5 discusses the photodissociation of OClO in a molecular beam. Although $ClO(^2\Pi)$ + $O(^3P)$ is dominant, $Cl(^2P)$ + O_2 also forms, with a max yield of 3.9±0.8% near 404nm.

In the past year we have focused most of our effort on the study of the 3pnl autoionizing states of Mg. Specifically, we have measured the angular distributions of electrons ejected from these states, we have carried out theoretical analyses of the experimentally determined angular distributions, and we have also made measurements of the autoionization rates of Mg 3pnk Stark states in electric fields. Finally, we have recorded the spectra of the autoionizing Ba 6pnk Stark states with very high optical powers to see the fine details in the wings of the spectra. Each of these activities is described in more detail in the ensuing paragraphs.

2087 (IC–92/168) **A tight binding model for the electronic structure of FCC and SC C_{60}.** Tit, N.; Kumar, V. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 5p. Order Number DE93606214. Source: OSTI; NTIS (US Sales Only); INIS.

Ab-initio calculations for K_3C_{60} indicate that the general features of the energy bands within LDA remain nearly unchanged as compared to C_{60}. In the electron-phonon pairing mechanism of superconductivity in these materials, the variation in T_c has been attributed to changes in the lattice constant which affects $N(E_F)$. We have therefore, fitted the valence and conduction bands of the fcc C_{60}, obtained by Troullier and Martins from an LDA plane wave basis calculations, with a tight binding model and studied the energy bands as a function of the lattice constant. As the overlap between orbitals on neighbouring balls is small, the band width is found to decrease by about 30% in going from K_3C_{60} to Rb_2CsC_{60}. The density of states, thus, obtained is used to estimate variation in T_c from McMillian's formula. These results are in good agreement with experimental data. Calculations of the energy bands are also presented for the low temperature Pa3-bar structure. (author). 12 refs, 3 figs, 1 tab.

2088 (LA-UR–92-3046) **Muon physics with the proposed Pulsed Lepton Source at LAMPF.** Leon, M.; Paciotti, M.A. Los Alamos National Lab., NM (United States). [1992]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9206276–2: Muon '92 workshop, Uppsala (Sweden), 28 Jun - 3 jul 1992). Order Number DE93000657. Source: OSTI; NTIS; INIS; GPO Dep.

The Pulsed Lepton Source (PLS) project opens some exciting possibilities for muon and neutrino physics . The PLS would use the 0.25 4s proton pulses from the upgraded Proton Storage Ring (PSR) at LAMPF to create short, intense bursts of muons and neutrinos. The neutrino beam would be used for a few fundamentally important weak interaction physics experiments. The muon beams would find a wide variety of applications in both fundamental and "applied" muon physics areas. After a brief discussion of the physical layouts of the PSR and the proposed PLS in Sec. 2 and muon area in Sec. 3, we note some of the muon physics experiments

and areas that could advantageously be addressed at the PLS in Secs. 4 and 5, and conclude in Sec. 6.

2089 (SLAC-PUB–5939) **Production of relativistic antihydrogen atoms by pair production with positron capture and measurement of the Lamb shift.** Munger, C.T. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Brodsky, S.J.; Schmidt, I. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Sep 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9207149–2: Hyperfine interactions of the anti-hydrogen workshop, Munich (Germany), 30-31 Jul 1992). Order Number DE93001767. Source: OSTI; NTIS; INIS; GPO Dep.

A beam of relativistic antihydrogen atoms-the bound state $(\bar{p}e^+)$– can be created by circulating the beam of an antiproton storage ring through an internal gas target. An antiproton which passes through the Coulomb field of a nucleus will create e^+e^- pairs, and antihydrogen will form when a positron is created in a bound instead of continuum state about the antiproton. The cross section for this process is roughly I Z^2 pb for antiproton momenta above 6 GeV/c. A sample of 200 antihydrogen atoms in a low-emittance, neutral beam will be made in 1994 as an accidental byproduct of Fermilab experiment E760. We describe a simple experiment, Fermilab Proposal P862, which can detect this beam, and outline how a sample of a few-10^4 atoms can be used to measure the antihydrogen Lamb shift to 1%.

2091 (IC–92/160) **The thermodynamic and structural contributions to the vacancy formation energies in hot rare gas solids.** Rashid, R.I.M.A. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 5p. Order Number DE93604742. Source: OSTI; NTIS (US Sales Only); INIS.

For the case of close-packed hot rare gas crystals, the vacancy formation energy E_v is expressed in terms of thermodynamic quantities at melting temperatures and contributions from state dependent structure. It is found that in the determination of the vacancy formation energy the thermodynamic term dominates. The structural contributions can be estimated from diffraction experiments and molecular dynamic data and are shown to be insignificant compared to the contributions of thermodynamic terms in argon and krypton. However, the structural corrections for neon are found to be moderate, suggesting that the three-body effects are important in neon. (author). 15 refs.

2092 (IC–92/191) **Electronic states in quantum wells with periodically structured interfaces.** Sun Hong. International Centre for Theoretical Physics, Trieste (Italy). Aug 1992. 20p. Order Number DE93606295. Source: OSTI; NTIS (US Sales Only); INIS.

The electronic energy sub bands and minigaps in Lateral-Surface-Superlattices (LSSLs) produced by deposition of A1As and GaAs fractional layers on (001) vicinal GaAs substrates were predicated by variational calculations. A coordinate transformation was introduced in the calculation which transforms the LSSLs with periodically structured interfaces to quantum wells with planar interfaces so that the boundary conditions of the electronic wave functions on the LSSL interfaces can be satisfied exactly. The calculations showed that our theory gives lower subband energies than those predicated by other variational calculations. The dependence of the energy minigaps between the first and second subbands on the LSSL structural parameters, such as the average widths of the LSSLs and the periods of their interface structures, was investigated. In the calculation, the barrier between GaAs and AlAs was assumed to be finite (=1.06eV) and infinite. The infinitely high potential barrier approximation (IHPBA) overestimates the energy minigap by 50% when the average width of the LSSL is 100A, and it reduces to 25% when the width is 200A. IHPBA does not work well when the average widths of the LSSLs are less than 200A. (author). 14 refs, 5 figs.

Lawrence Berkeley Lab., CA (United States). Jul 1992. 8p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant NAG3-1143;Grant DMS89-02831. (CONF-921110–29: Winter annual meeting of the American Society of Mechanical Engineers, Anaheim, CA (United States), 8-13 Nov 1992). Order Number DE93000635. Source: OSTI; NTIS; GPO Dep.

Large shifts of liquid arising from small changes in certain container shapes in zero gravity can be used as a basis for accurately determining contact angle. "Canonical" geometries for this purpose,

recently developed mathematically, are investigated here computationally. It is found that the desired "nearly- discontinuous" behavior can be obtained and that the shifts of liquid have sufficient volume to be readily observed.

2098 (CEA-CONF–10996) **Study of deuterium diffusion in amorphous $Zr_3RhD_{4.3}$ by ^{181}Ta spin relaxation.** Baudry, A. (CEA Centre d'Etudes de Grenoble, 38 (France). Dept. de Recherche Fondamentale sur la Matiere Condensee); Boyer, P.; Ferreira, L.P. CEA Centre d'Etudes de Grenoble, 38 (France). Direction des Sciences de la Matiere. 1992. 7p. (CONF-9206175–: Interaction symposium on metal-hydrogen systems, Uppsala (Sweden), Jun 1992). Order Number DE93721105. Source: OSTI; NTIS (US Sales Only); INIS.

The diffusion of deuterium in amorphous $Zr_3RhD_{4.3}$ was studied by γ-γ Perturbed Angular Correlations (PAC) using ^{181}Ta as a quadrupole probe in substitution for Zr. The temperature dependence of the spin relaxation rate is well reproduced assuming a Gaussian distribution of activation energies with a relative width of about 20% around a mean value $E_a = 0.14(2)eV$. The results support the idea that deuterium diffuses mostly between face-shared 4Zr tetrahedra. Such easy diffusion, paths could be interrupted by 'traps', as suggested by comparing our PAC data with NMR data on a-Zr_3RhH_x.

2099 (CEA-CONF–10997) **Diffusion of positive muon and hydrogen in Hf_2CoH_x compounds.** Baudry, A. (CEA Centre d'Etudes de Grenoble, 38 (France). Dept. de Recherche Fondamentale sur la Matiere Condensee); Boyer, P.; Pontonnier, L.; Miraglia, S.; Harris, S.W.; Ferreira, L.P.; Ayres de Campos, N. CEA Centre d'Etudes de Grenoble, 38 (France). Direction des Sciences de la Matiere. 1992. 3p. (CONF-9206175–: Interaction symposium on metal-hydrogen systems, Uppsala (Sweden), Jun 1992). Order Number DE93721106. Source: OSTI; NTIS (US Sales Only); INIS.

In recent years, the diffusional motion of hydrogen and its isotopes - including the positive muon - in intermetallic lattices has been extensively studied. A valuable way to get a deeper insight into the diffusion mechanisms is to compare the hopping frequencies of different hydrogen isotopes in a large temperature range. It is known that both H f_2Co and H f_2CoH_x ($x < 3.5$) display a Ti_2Ni - type cubic structure. However, the arrangement of hydrogen atoms in the available interstitial sites in Hf_2CoH_x is not presently known. It is nevertheless reasonable to consider that the occupancies determined by neutron diffraction for the isostructural compounds Hf_2FeH_x remain valid in H f_2CoH_x. Thus, most hydrogen atoms (>80%) are expected to stay in 3Hf-1Co tetrahedra for $x<3$. Tetrahedral holes with a 2Hf-2Co coordination can be significantly occupied for higher H concentrations. In spite of favourable factors such as chemical affinity and geometry, octahedral 6Hf sites remain remarkably empty.

2100 (CEA-CONF–11036) **Inelastic neutron scattering study of the spin dynamics in the high temperature superconducting system $YBa_2Cu_3O_{6+x}$.** Regnault, L.P. (CEA Centre d'Etudes de Grenoble, 38 (France). Dept. de Recherche Fondamentale sur la Matiere Condensee); Burlet, P.; Henry, J.H.; Rossat-Mignod, J.; Bourges, P. CEA Centre d'Etudes de Grenoble, 38 (France). Dept. de Recherche Fondamentale sur la Matiere Condensee. 1992. 32p. (CONF-9204203–: Gentnet-Kastler Price, Berlin (Germany), 1 Apr 1992). Order Number DE93721681. Source: OSTI; NTIS (US Sales Only); INIS.

We report on inelastic neutron scattering experiments carried out on single-crystals of the $YBa_2Cu_3O_{6+x}$ system. The spin dynamics has been systematically investigated in the six typical regimes: the pure and doped AF states ($x = 0.15, 0.37$), the weakly doped ($x = 0.45, 0.51$), the heavily doped ($x = 0.69, 0.92$) and the overdoped ($x = 1$) metallic states which all exhibit a superconducting ground state. The hole doping strongly affects the AF-order, dynamical QF-correlations remain in the metallic state. An energy gap has been discovered in the spin excitation spectrum of any superconducting samples, however, it becomes weaker close to the I-M transition. A quite unusual T-dependence of the spin excitation spectrum was found. (author). 22 refs., 18 figs.

2101 (DOE/ER/45445–4) **Surface physics with cold and thermal neutron reflectometry: Progress report, April 1, 1991–March 31, 1992.** Steyerl, A. Rhode Island Univ., Kingston, RI (United States). Nov 1991. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER45445. Order Number DE93001986. Source: OSTI; NTIS; INIS; GPO Dep.

Three aspects of the research project "Surface physics with cold and ultracold neutron reflectometry" were stressed during the present first year: (1) Setup of the reflectometer facility at the research reactor of the Rhode Island Nuclear Science Center. The installation provides a narrow "pencil beam" analyzed by time of flight using a chopper system. Following beam characterization and a test measurement of the total cross section of copper single crystal first reflectivity measurements are currently performed using a supermirror. (2) Design stud for the ultracold neutron imaging system, with involvement of the relevant industry. Bids are available for several components indicating that it will be very difficult to build the entire system unless further funds become available. (3) Analysis of features of neutron reflection from surfaces with special emphasis on the effect of surface roughness both on the specular beam and the diffusely reflected and refracted intensity. Previous theoretical studies were supplemented by further numerical calculations of diffuse scattering distributions using different models. Application of ultracold and cold neutron reflectometry to the study of liquid-vapor phase transition were discussed. The theoretical work also includes the development of tentative ideas for novel fundamental physics experiments.

In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. NUCLEAR QUADRUPOLE RESONANCE/nmr imaging; SOLIDS/measuring methods; SOLIDS

2123 (INIS-BR–2933, pp. 303) **ESR of $Zn(L\text{-}Leucine)_2$ crystals with $^{63}Cu(II)$ impurities.** Steren, C.A. (Consejo Nacional de Investigaciones Cientificas y Tecnicas, Buenos Aires (Argentina). INTEC); Calvo, R. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Spanish). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. CRYSTALS/electron spin resonance; COPPER 63; CRYSTALS; GYROMAGNETIC RATIO; HYPERFINE STRUCTURE; IMPURITIES; ISOTOPIC EXCHANGE; LEUCINE; NITROGEN 15; ZINC

2124 (INIS-BR–2933, pp. 303) **CESR and phase transformations in receiver intercalate graphites.** Gennaro, A.M. (Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica); Rettori, C.; Barberis, G.E.; Sartori, J.C. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. GRAPHITE/electron spin resonance; GRAPHITE/phase transformations; FREQUENCY DEPENDENCE; GRAPHITE; LINE WIDTHS; TEMPERATURE DEPENDENCE; TEMPERATURE RANGE 0273-0400 K; TRANSITION TEMPERATURE

2125 (INIS-BR–2933, pp. 303) **Exchange collapse of the EPR lines in a 2-dimensional paramagnet.** Martino, D.M. (Consejo Nacional de Investigaciones Cientificas y Tecnicas, Buenos Aires (Argentina). INTEC); Calvo, R.; Passeggi, M.C.G. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. MONOCRYSTALS/electron spin resonance; COPPER IONS; EXCHANGE INTERACTIONS; GYROMAGNETIC RATIO; MONOCRYSTALS; PARAMAGNETISM; TWO-DIMENSIONAL CALCULATIONS

2126 (INIS-BR–2933, pp. 304) **Studies on the plane square complex of copper(II)-three-phenyl-arsenic oxide, in the Q band by ESR.** Lima e Lara, M.C.F. (Brasilia Univ., DF (Brazil). Dept. de Fisica); Nascimento, O.R. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics,

Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. CRYSTAL STRUCTURE/electron spin resonance; COPPER COMPLEXES; SPECTROMETERS

2127 (INIS-BR–2933, pp. 304) **Proton nuclear magnetic resonance in $Ni_{36}Zr_{32}Hf_{32}H_{1.36}$, $Ni_{36}Zr_{32}Hf_{33}H_{1.20}$ and $Ni_{36}Zr_{64}H_{0.50}$ metallic glasses.** Wolney Filho, W. (Goias Univ., Goiania, GO (Brazil). Dept. de Fisica); Titman, J.M.; Havill, R.L. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. METALLIC GLASSES/nuclear magnetic resonance; HAFNIUM; HYDROGEN; NICKEL; RELAXATION TIME; SPIN-LATTICE RELAXATION; TEMPERATURE DEPENDENCE; TEMPERATURE RANGE 0273-0400 K; ZIRCONIUM

2128 (INIS-BR–2933, pp. 304) **Measurements of spin-lattice relaxation time T_1 of protons in hydrogenated metallic alloys.** Wolney Filho, W. (Goias Univ., Goiania, GO (Brazil). Dept. de Fisica); Titman, J.M.; Havill, R.L. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. METALLIC GLASSES/spin-lattice relaxation; HAFNIUM HYDRIDES; PROTONS; RELAXATION TIME; SPIN; TEMPERATURE DEPENDENCE; TEMPERATURE RANGE 0273-0400 K; VANADIUM

2129 (INIS-BR–2933, pp. 305) **Crystalline and molecular vibrations in $(C_2H_5)_4NFeX_4$ compounds (X Cl, Br).** Partiti, C.S.M. (Sao Paulo Univ., SP (Brazil). Inst. de Fisica); Rechenberg, H.R. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. VIBRATIONAL STATES/moessbauer effect; LATTICE VIBRATIONS; ORGANIC NITROGEN COMPOUNDS; TEMPERATURE DEPENDENCE; TEMPERATURE RANGE 0065-0273 K

2130 (INIS-BR–2933, pp. 306) **Cr(III) electron spin resonance in calcium, gallium and germanium garnet.** Moraes, I.J. (Goias Univ., Goiania, GO (Brazil). Dept. de Fisica); Sartori, J.C.; Nascimento, O.R.; Terrile, M.C. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. GARNETS/electron spin resonance; CALCIUM; CHROMIUM IONS; GALLIUM; GARNETS; GERMANIUM; GHZ RANGE 01-100; GYROMAGNETIC RATIO; MEASURING METHODS

2131 (INIS-BR–2933, pp. 307) **Study on Cu(II) ion chains in Cu(L-glutamine) by ESR.** Casado, N. (Consejo Nacional de Investigaciones Cietificas y Tecnicas, Buenos Aires (Argentina). INTEC); Brondino, C.; Calvo, R.; Nascimento, O.R. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. MONOCRYSTALS/electron spin resonance; ANGULAR DISTRIBUTION; COPPER IONS; GLUTAMINE; GYROMAGNETIC RATIO; ION EXCHANGE; MONOCRYSTALS

2132 (INIS-BR–2933, pp. 307) **The first experience in 2D-exchange NQR technique.** Gonzalez, C.E. (Universidad Nacional de Cordoba (Argentina). Fac. de Matematica, Astronomia y Fisica); Pusiol, D.J. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Spanish). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. NUCLEAR QUADRUPOLE RESONANCE/chloroform; ELECTRIC FIELDS; MAGNETIZATION; CHLOROFORM; RELAXATION TIME; SPECTROMETERS; TEMPERATURE DEPENDENCE; TEMPERATURE RANGE 0273-0400 K

2133 (INIS-BR–2933, pp. 313) **Influence of deposition parameters of Fe thin films of Si <100> and Si <111> in Fe-Si reaction.** Paula, D. de (Rio Grande do Sul Univ., Porto Alegre, RS (Brazil)); Amaral, L.; Souza, J.P. de; Schreiner, W.H. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. THIN FILMS/deposition; ANNEALING; ELECTRIC CONDUCTIVITY; ELECTRON GUNS; IRON; MOESSBAUER EFFECT; OXIDATION; RUTHERFORD SCATTERING; SILICON; DEPOSITION; X-RAY DIFFRACTION

2134 (INIS-BR–2933, pp. 315) **Density of states and Moessbauer hyperfine interactions of Sn compounds.** Terra, J. (Centro Brasileiro de Pesquisas Fisicas (CBPF), Rio de Janeiro, RJ (Brazil)); Guenzburger, D. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. TIN COMPOUNDS/moessbauer effect; CHARGE DISTRIBUTION; ELECTRONIC STRUCTURE; TIN 119

2135 (INIS-BR–2933, pp. 318) **Epitaxy growth of high quality GaInP/GaAs heterostructures.** Macahdo, A. (TELEBRAS, Campinas, SP (Brazil). Centro de Pesquisas); Omnes, F.; Razeghi, M. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. CRYSTAL STRUCTURE/x-ray diffraction; CARRIER MOBILITY; CHEMICAL VAPOR DEPOSITION; EPITAXY; GALLIUM ARSENIDES; GALLIUM PHOSPHIDES; HALL EFFECT; INDIUM COMPOUNDS; LAYERS; LINE WIDTHS; PHOTOLUMINESCENCE

2136 (INIS-BR–2933, pp. 320) **Characterization of semiconductor III-V alloy epitaxy layers using x-ray diffractometry.** Souza, C.F. de (TELEBRAS, Campinas, SP (Brazil). Centro de Pesquisas); Carvalho Junior, W.; Gazetta Filho, H. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. SEMICONDUCTOR MATERIALS/x-ray diffraction; EPITAXY; LATTICE PARAMETERS; LAYERS

2137 (INIS-BR–2933, pp. 336) **Electrical and structural properties of AuZn/p-GaSb ohmic contact.** Oyama, A.M. (Sao Carlos Univ., SP (Brazil). Dept. de Fisica); Oliveira, R. de; Pizani,

P.S.; Galzerani, J.C.; Cardoso, L.P.; Morelhao, S.L.; Landers, R. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355--: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. FILMS/electric conductivity; ANNEALING; ANTIMONY; AUGER ELECTRON SPECTROSCOPY; DEPOSITION; FILMS; GALLIUM; GOLD; MICROSTRUCTURE; X-RAY DIFFRACTION; ZINC

2138 (INIS-BR–2933, pp. 337) **Purification of gallium by physico-chemical processes.** Carvalho, R.S. (Minas Gerais Univ., Belo Horizonte, MG (Brazil). Inst. de Ciencias Exatas); Carvalho, R.P. de. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355--: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. GALLIUM/purification; CHEMICAL PREPARATION; CRYSTAL GROWTH; EMISSION SPECTROSCOPY; GALLIUM; PURIFICATION; IMPURITIES; RAMAN SPECTROSCOPY; X-RAY DIFFRACTION; X-RAY FLUORESCENCE ANALYSIS

2139 (INIS-BR–2933, pp. 340) **Influence of interfacial surface of SI <100>, <111> and amorphous on reaction of Fe and SI thin films.** Paula, D. de; Amaral, L.; Souza, J.P. de. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355--: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. THIN FILMS/moessbauer effect; ELECTRIC CONDUCTIVITY; HEAT TREATMENTS; IRON; ORIENTATION; RUTHERFORD SCATTERING; SILICON; SURFACES

2140 (INIS-BR–2933, pp. 344) **^{57}Ion implantation in superconducting materials.** Marest, G. (Universite Bernard, 43 - Lyon (France). Inst. de Physique Nucleaire); Baggio-Saitovitch, E.M. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355--: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. SUPERCONDUCTORS/ion implantation; BARIUM; COPPER; IRON 57; MOESSBAUER EFFECT; SUPERCONDUCTORS; YTTRIUM

2141 (INIS-BR–2933, pp. 344) **Kinetic study on oxygen desorption in Fe: $YBa_2Cu_3O_{7-d}$ superconducting oxides.** Baggio-Saitovitch, E.M. (Centro Brasileiro de Pesquisas Fisicas (CBPF), Rio de Janeiro, RJ (Brazil)); Scorzelli, R.B.; Souza Azevedo, I.; Litterst, F.J.; Micklitz, H.R. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355--: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. SUPERCONDUCTORS/moessbauer effect; BARIUM; COPPER OXIDES; DESORPTION; IRON 57; OXYGEN; SUPERCONDUCTORS; YTTRIUM

2142 (INIS-BR–2933, pp. 345) **Magnetic ordering in Fe: $YBa_2Cu_3O_7$ superconducting oxides.** Baggio-Saitovitch, E.M. (Centro Brasileiro de Pesquisas Fisicas (CBPF), Rio de Janeiro, RJ (Brazil)); Litterst, F.J. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355--: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. SUPERCONDUCTORS/moessbauer effect; BARIUM; COPPER OXIDES; ELECTRIC FIELDS; IRON IONS; MAGNETIC FIELDS; SUPERCONDUCTORS; TEMPERATURE DEPENDENCE; YTTRIUM

2143 (INIS-BR–2933, pp. 357) **Study on electronic structure of superconductors at high temperature by x-ray absorption spectroscopy (XAS).** Tolentino, H.C.N. (Laboratorio Nacional de Luz Sincrotron (LNLS), Campinas, SP (Brazil)). Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355--: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. SUPERCONDUCTORS/electronic structure; SUPERCONDUCTORS/x-ray spectroscopy; BARIUM; COPPER OXIDES; CRITICAL TEMPERATURE; OXIDATION; REDUCTION; SUPERCONDUCTORS; YTTRIUM

2144 (INIS-BR–2933, pp. 361) **Characterization of tin oxide thin films deposited of magnetron sputtering.** Soares, M.R. (Rio Grande do Sul Univ., Porto Alegre, RS (Brazil). Inst. de Fisica); Dionisio, P.H.; Baumvol, I.J.R.; Schreiner, W.H. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355--: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. THIN FILMS/deposition; CHEMICAL COMPOSITION; ELECTRIC CONDUCTIVITY; MOESSBAUER EFFECT; SPUTTERING; DEPOSITION; TIN OXIDES; X-RAY DIFFRACTION

2145 (INIS-BR–2933, pp. 361) **Dynamics study on resistivity of Fe/FeN multilayers.** Huebler, R. (Rio Grande do Sul Univ., Porto Alegre, RS (Brazil). Inst. de Fisica); Soares, M.R.; Baumvol, I.J.R.; Schreiner, W.H. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355--: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. LAYERS/electric conductivity; ANNEALING; IRON; LAYERS; MOESSBAUER EFFECT; NITROGEN; PHASE TRANSFORMATIONS; RUTHERFORD SCATTERING; SPUTTERING; X-RAY DIFFRACTION

2146 (INIS-BR–2933, pp. 361) **Production, chemical, morphological and structural characterization of titanium nitride thin films.** Brasil Junior, W. (Universidade Federal, Rio de Janeiro, RJ (Brazil). Coordenacao dos Programas de Pos-graduacao de Engenharia); Achete, C.; Mattoso, N. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355--: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. THIN FILMS/structural chemical analysis; AUGER ELECTRON SPECTROSCOPY; CHEMICAL COMPOSITION; RUTHERFORD SCATTERING; SCANNING ELECTRON MICROSCOPY; TITANIUM NITRIDES; TRANSMISSION ELECTRON MICROSCOPY; X-RAY DIFFRACTION

2147 (INIS-BR–2933, pp. 362) **Characterization of silicon nitride thin films deposited by reactive RF sputtering in function of deposition patameters.** Stedile, F.C. (Rio Grande do Sul Univ., Porto Alegre, RS (Brazil). Inst. de Quimica); Baumvol, I.J.R.; Schreiner, W.H.; Freire Junior, F.L. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355--: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. THIN FILMS/deuteron reactions; ALPHA PARTICLES; ALPHA REACTIONS; CRYSTAL STRUCTURE; DEPOSITION; HEAT TREATMENTS; NITROGEN 14 TARGET; PROTONS; SILICON NITRIDES; SPUTTERING; STOICHIOMETRY; X-RAY DIFFRACTION

2148 (INIS-BR–2933, pp. 363) **Obtainment and characterization of tin nitride by reactive sputtering.** Lima, R.S. (Rio Grande do Sul Univ., Porto Alegre, RS (Brazil). Inst. de Fisica); Dionisio, P.H.; Schreiner, W.H.; Achete, C. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. FILMS/crystal structure; DEPOSITION; FILMS; MOESSBAUER EFFECT; QUANTITY RATIO; SPUTTERING; STOICHIOMETRY; TIN NITRIDES; X-RAY DIFFRACTION

2149 (INIS-BR–2933, pp. 363) **Obtainment of Fe and Sn amorphous alloys bu co-evaporation and sputtering.** Hallouche, B. (Rio Grande do Sul Univ., Porto Alegre, RS (Brazil). Inst. de Fisica); Vasquez, A.; Schreiner, W.H.; Teixeira, S.R.; Schmidt, J.E.; Dionisio, P.H.; Achete, C. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. THIN FILMS/sputtering; AMORPHOUS STATE; EVAPORATION; HEAT TREATMENTS; IRON; MAGNETIZATION; MOESSBAUER EFFECT; RUTHERFORD SCATTERING; SILICON; SUBSTRATES; SPUTTERING; TIN; TRANSMISSION ELECTRON MICROSCOPY; X-RAY DIFFRACTION

2150 (INIS-BR–2933, pp. 373) **Characterization of KCl:CuCl amorphous thin films.** Oliveira, L. de (Sao Paulo Univ., Sao Carlos, SP (Brazil). Inst. de Fisica e Quimica); Li, M.S. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. THIN FILMS/amorphous state; ABSORPTION; COPPER CHLORIDES; IMPURITIES; POTASSIUM CHLORIDES; X-RAY DIFFRACTION

2151 (INIS-BR–2933, pp. 373) **Diamond obtainment by CVD on Si(100) substrate.** Fritzen, C.L. (Rio Grande do Sul Univ., Porto Alegre, RS (Brazil). Inst. de Fisica); Hinrich, R.; Livi, R.P.; Jornada, J.A.H. da. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. DIAMONDS/chemical vapor deposition; CRYSTAL STRUCTURE; DIAMONDS; SCANNING ELECTRON MICROSCOPY; SILICON; SUBSTRATES; X-RAY DIFFRACTION

2152 (INIS-BR–2933, pp. 374) **Deposition and characterization of amorphous carbon thin films hydrogenated and nitrogenated with diamond type properties.** Franceschini, D.F. (PETROBRAS Quimica S.A. (PETROQUISA), Rio de Janeiro, RJ (Brazil)); Achete, C.A. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. THIN FILMS/amorphous state; CARBON; DEPOSITION; ELECTRIC CONDUCTIVITY; HARDNESS; INFRARED SPECTRA; SILICON; SUBSTRATES; X-RAY DIFFRACTION

2153 (INIS-BR–2933, pp. 375) **Formation of silicides on Cu(100)/Si(100), Cu/Si(111), Cu/a-Si and Cu/a-Si:H interfaces analysed by x-ray diffraction.** Mattoso, N. (Universidade Federal, Rio de Janeiro, RJ (Brazil). Coordenacao dos Programas de Posgraduacao de Engenharia); Achete, C.A. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. INTERFACES/x-ray diffraction; COPPER; DEPOSITION; HYDROGEN; INTERFACES; MONOCRYSTALS; ORIENTATION; SILICIDES; SILICON; SPUTTERING; TEMPERATURE RANGE 0400-1000 K; THIN FILMS

2154 (INIS-BR–2933, pp. 375) **Co/Pd multilayers: preparation and characterization by RX.** Schelp, L.F. (Rio Grande do Sul Univ., Porto Alegre, RS (Brazil). 2158 (JINR-E-3-90-293) **A new polarized neutrons method for studying depth-inhomogeneously magnetized magnetic films.** Korneev, D.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1990. 8p. Order Number DE93606304. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Z. Phys., B: Condens. Matter.

The main specific features of the process of polarized thermal neutrons specular reflection from the surface of depth-inhomogeneously magnetic films are considered theoretically. It is shown how using the method of specular reflection of polarized thermal neutrons from such a films surface, one may restore the depth distribution of the local magnetization vector M-vector(z). 9 refs.

2159 (JINR-E-11-90-599) **The demagnetizing factors for the rectangular samples.** Akishin, P.G.; Gaganov, I.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1990. 10p. Order Number DE93606303. Source: OSTI; NTIS (US Sales Only); INIS.

The influence of the demagnetization effect on the distribution of internal magnetic fields for finite samples is considered. The boundary integral method is used to compute the space distribution of the magnetic field in rectangular samples. On the basis of these calculations we compute the distribution of demagnetization factors in the sample for μSR experimental set-up with the real field geometry. The corresponding mathematical expectation and dispersion of this distribution are estimated. The results of the calculation are used in the analysis of the μSR data obtained for high T_c superconductors. It is shown for these compounds that the correction to the penetration depth related to the broadening of the field distribution, is not more than 5%. 8 refs.; 2 figs.; 1 tab.

2160 (JINR-R-3-91-392) **Slow neutron scattering on ThO_2 and UO_2.** Kozlov, Zh.A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics); Semenov, V.A.; Padureanu, I.; Rapeanu, S.; Rotaresku, G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1991. 15p. (In Russian). Order Number DE93606306. Source: OSTI; NTIS (US Sales Only); INIS.

The results of the inelastic neutron scattering experiments on ThO_2 and UO_2 are presented. The frequency spectrum $g(\hbar w)$ for ThO_2 and UO_2 at room temperature is obtained. The function $g(\hbar w)$ for ThO_2 is obtained also at temperatures T=778 K and 1278 K. The experiments were performed on the spectrometer DIN-2pi at the IBR-2 reactor. 30 refs.; 13 figs.; 1 tab.

2161 (JINR-R-14-91-94) **Investigation of Y-Ba-Cu-O films using backscattering of $^4He^+$ Ions.** Kobzev, A.P. (and others); Machajdik, D.; Sandrik, R. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 12p. (In Russian). Order Number DE93606305. Source: OSTI; NTIS (US Sales Only); INIS.

Backscattering spectra of Y-Ba-Cu-O films using $^4He^+$ -ions beam were investigated at the angle 171 deg. It was shown that the backscattering analysis is suitable to determine film thickness, elemental composition, depth distribution for all elements in the film as well as interaction between film and substratum. 9 refs.; 10 figs.

2162 (ANL/CP-77000) **C_{60} interactions with surfaces, gaseous species and photons: An overview.** Gruen, D.M. Argonne National Lab., IL (United States). [1992]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920945-1: Workshop on inelastic ion surface collisions, Aussois (France), 14-18 Sep 1992). Order Number DE92040738. Source: OSTI; NTIS; INIS; GPO Dep.

The behavior of C_{60} in collisions with surfaces, with other gaseous species, and with photons is discussed. The focus is on the processes leading to fragmentation of the molecule, the identification of fragmentation products, and the mechanism of fragmentation. The nature of the fragmentation process of C_{60} is of considerable interest in itself and needs to be understood in detail if C_{60} cluster ion beams are to be fully exploited technologically. In addition, one may anticipate that an understanding of C_{60} fragmentation will contribute mutatis mutandis to an elucidation of the elementary steps leading to the assembly of C_{60} from smaller carbon clusters.

2163 (CONF-9206275-2) **Above-surface neutralization of highly charged ions: The formation of hollow atoms.** Burgdoerfer, J. (Tennessee Univ., Knoxville, TN (United States). Dept. of Physics); Meyer, F. Oak Ridge National Lab., TN (United States). [1992]. 22p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. From Nobel symposium on heavy ion spectroscopy and QED effects in atomic systems; Saltsjoebaden (Sweden); 29 Jun - 3 jul 1992. Order Number DE93001371. Source: OSTI; NTIS; INIS; GPO Dep.

We investigate the interaction of multiply charged ions with metallic surfaces. Simulations are presented displaying the formation of hollow atoms when slow highly charged ions approach the surface. It is shown that above surface neutralization proceeds via hollow-atom formation. Relaxation of the multiply excited states to the ground state occurs only subsequent to the close encounter with the topmost atomic layer. Recent experimental data on K Auger emission and image acceleration confirm this scenario.

2164 (DOE/ER/14224-1) **Atomic probes of surface structure and dynamics: Technical progress report, September 15, 1992–September 14, 1993.** Heller, E.J.; Jonsson, H. Washington Univ., Seattle, WA (United States). Dept. of Chemistry. [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-91ER14224. Order Number DE92040066. Source: OSTI; NTIS; INIS; GPO Dep.

Progress for the period Sept. 15, 1992 to Sept. 14, 1993 is discussed. Semiclassical methods that will allow much faster and more accurate three-dimensional atom–surface scattering calculations, both elastic and inelastic, are being developed. The scattering of He atoms from buckyballs is being investigated as a test problem. Somewhat more detail is given on studies of He atom scattering from defective Pt surfaces. Molecular dynamics simulations of He^+ and Ar^+ ion sputtering of Pt surfaces are also being done. He atom scattering from Xe overlayers on metal surfaces and the thermalized dissociation of H_2 on Cu(110) are being studied. (R.W.R.) 64 refs.

A radiation of electrons and positrons in single crystals in coherent bremsstrahlung (CBS) region has been considered for the case when CBS has the most hard spectrum. Under this condition a particle moves near a crystalline plane (in fcc(d) crystal for axis (001) this is the plane (110)) and influence of the continuous plane potential should be taken into account. This potential gives additional contribution in soft part of the spectrum and affects on hard photon emission. Observation of this phenomena at high energy is discussed. 14 refs.; 5 figs.; 1 tab.

2186 (JINR-R–2-91-333) **Heat generation produced in thin layers of GaAs superconductors under high energy particles irradiation.** Barashenkov, V.S. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation); Sosnin, A.N.; Shmakov, S.Yu.; Polanski, A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. 3p. (In Russian). Order Number DE93606332. Source: OSTI; NTIS (US Sales Only); INIS.

Monte Carlo simulation of heat generation spectra in thin (50-100 μm) layers of GasAs is carried out basing on interactions of protons and ^{12}C ions at 3.65 GeV/c. These calculated results are compared to those for silicon. The most important from the point of view of radiation damages of semiconductor devices, is mainly determined by macroscopic cross-section and the spectrum is weakly dependent on the type of bombarding particle and composition of the target. 2 refs.; 3 figs.

2187 (JINR-R–13-91-158) **Energy spectra and photoelectron work function from $YBa_2Cu_3O_7$ high-T_c superconductor.** Matora, I.M. (and others); Bogdzel', A.A.; Zhuravlev, V.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1991. 10p. (In Russian). Order Number DE93606329. Source: OSTI; NTIS (US Sales Only); INIS.

The results are presented of the experiments on the JINR newly built instrument for the photoelectron spectroscopy by the time-of-flight method. The energy resolution achieved was (0.2-0.05 eV). The electron work function ϕ from three samples of polycrystalline high-T_c superconductor $YBa_2Cu_3O_7$ have ben masured to be $\phi=(5.5\pm0.2)$ eV. Spectra of photoelectrons in dependence on time and energy are given. 4 refs.; 5 figs.

2188 (JINR-R–13-91-313) **Alpha-particle backscattering from an iron plate surface ($0.5\ MeV<E_\alpha<C_{barrier}$).** Kuznetsova,

M.Ya.; Chumin, V.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 19p. (In Russian). Order Number DE93606330. Source: OSTI; NTIS (US Sales Only); INIS.

Probability of alpha-particle backscattering from an iron plate surface, energies and angular distributions of backscattering particles are obtained through the Monte-Carlo method. The plates thickness was taken greater than the mean free path of particles. The calculations are performed for alpha-particles with initial energies 3.0, 4.5 and 6.0 MeV and incident on the iron plate surface at the angles 0.5, 2.5 and 5.0 degrees. The data are compared with the results of analytical calculations by the equation from the literature. The purpose of this work is to obtain data fro estimating influence of backscattering of alpha-particles from the walls and the parts of the spectrometer vacuum chamber on the shape of experimental spectra. 11 refs.; 6 figs.; 2 tabs.

2189 (JINR-R–14-90-352) **Damage produced by swift heavy ions in monocrystalline tungsten.** Bugrov, V.N.; Karamyan, S.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions. 1990. 12p. (In Russian). Order Number DE93606331. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Fiz. Khim. Obrab. Mater.

The damage of monocrystalline tungsten produced by heavy ions up to Xe at energy from 0.6 to 8.0 MeV/a.m.u. is studied. The direct crystallographic method based on the crystal-blocking effect is applied. The scaling of the dose dependences of the damage for different ions is observed. The variation of the ion damaging power corresponds to the model of the defects generation as a result of nuclear scattering. The contribution of ions electronic energy losses to the tungsten damage is not found. 20 refs.; 3 figs.; 1 tab.

2190 (LA-UR–92-3126) **Chaotic dynamics in the Maxwell-Bloch equations.** Holm, D.D. (Los Alamos National Lab., NM (United States)); Kovacic, G. Los Alamos National Lab., NM (United States). 6 Mar 1992. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9002140–2: Chaos down under, Sydney (Australia), Feb 1990). Order Number DE93000854. Source: OSTI; NTIS; INIS; GPO Dep.

In the slowly varying envelope approximation and the rotating wave approximation for the Maxwell-Bloch equations, we describe how the presence of a small-amplitude probe laser in an excited, two-level, resonant medium leads to homoclinic chaos in the laser-matter dynamics. We also describe a derivation of the Maxwell-Bloch equations from an action principle.

2191 (NIIEFA-P-D–0826) **Investigation of silicon dioxide buried layers by ion Rutherford backscattering.** Bortnyanskij, A.L.; Klopenkov, M.L.; Pavlovets, M.V.; Shemilinin, S.G. Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (Russian Federation). 1989. 6p. (In Russian). Order Number DE93606333. Source: OSTI; NTIS (US Sales Only); INIS.

Methods for investigation into $Si/SiO_2/Si$ type structures by ion Rutherford backscattering method are described. The methods are tested on silicon plates with an oxide film on the surface, covered by a pure silicon layer. The results obtained show that the given methods allow one to realize the limiting capabilities of the method. 7 refs.; 4 figs.

2192 (WIS-PH–92-28) **Monte-Carlo simulations of secondary electron emission from CsI, induced by 1-10 keV X-rays and electrons.** Akkerman, A.; Gibrekhterman, A.; Breskin, A.; Chechik, R. Weizmann Inst. of Science, Rehovoth (Israel). May 1992. 19p. Order Number DE93604906. Source: OSTI; NTIS (US Sales Only); INIS.

A model for electron transport and emission in CsI is proposed. It is based on theoretically calculated microscopic cross-sections for electron interaction with the nuclear and the electronic components of the solid. A Monte Carlo program based on this model was developed to simulate secondary electron emission induced by X-rays and electrons in the energy range of 1 to 10 keV. The calculated secondary emission yields agree with existing experimental data. The model provides all necessary characteristics for the design of radiation detectors based on secondary electron emission. It can be expanded to higher incident energies and other alkali halides. (author).

2194 (ANL/CP–77115) **Domain decomposition: A blowup problem and the Ginzburg–Landu equations.** Kwong, Man Kam. Argonne National Lab., IL (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9209217–1: NATO workshop on numerical methods for partial differential equations and critical parameters, Beaune (France), 25-28 Sep 1992). Order Number DE92040736. Source: OSTI; NTIS; GPO Dep.

In two of our recent projects, the technique of domain decomposition plays a crucial role in the numerical integration of the partial differential equations. In our problems, the local behavior varies because of the nonlinear and singular nature of the equations. Attempts to introduce different length scales did not lead to improvement. We found that different form of the equations have to be used over different subdomains. The first project arises in an effort to determine the profile at the moment of blowup or quenching of a nonlinear heat equation. The second project arises in the investigation of the Ginzburg-Landau equation in the theory of superconductivity.

2195 (ANL/CP–77139) **Fabrication and properties of high-$T_c$tapes and coils made from silver-clad Bi-2223 superconductors.** Haldar, P. (Intermagnetics General Corp., Guilderland, NY (United States)); Hoehn, J.G. Jr.; Rice, J.A.; Motowidlo, L.R.; Balachandran, U.; Youngdahl, C.A.; Tkaczyk, J.E.; Bednarczyk, P.J. Argonne National Lab., IL (United States). Aug 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920802–13: Applied superconductivity conference, Chicago, IL (United States), 23-28 Aug 1992). Order Number DE92040760. Source: OSTI; NTIS; GPO Dep.

Long lengths of flexible silver-clad Bi-2223 high-$T_c$superconductors have been fabricated by the powder-in-tube. technique. By improving process conditions dc transport measurements at liquid helium (4.2K) and hydrogen (20K) temperatures yield J_c's greater than 10^5 A/cm^2 at zero field and exceed 3×10^4 A/cm^2 at liquid nitrogen (77K) temperature in short tape samples. Detailed microstructural analysis and J_c measurements with applied fields up to 20 T are reported. Coils have been fabricated from 1 meter lengths of conductor with J_c's at 77K approaching 10^4 A/cm^2. Measurements on small pancake coils made from 10 meter tapes are also reported.

2196 (ANL/CP–77443) **Design and test of a superconducting structure for high-velocity ions.** Delayen, J.R.; Kennedy, W.L.; Roche, C.T. Argonne National Lab., IL (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9208109–64: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93000513. Source: OSTI; NTIS; INIS; GPO Dep.

Following the successful development of a niobium coaxial half-wave structure we have designed, built and tested a new half-wave geometry: the spoke resonator. This geometry is better suited for

high frequency resonators and for the acceleration of high velocity ions. The prototype cavity is a 2-gap structure resonating at 855 MHz, and optimized for particle velocity of 0.30 c. It is easier to manufacture than the coaxial half-wave resonator and the geometry can be straightforwardly extended to multigap designs. Rf-tests have been performed on this cavity both prior to and after high temperature annealing. An accelerating gradient of 7.2 MV/m (cw) and 7.8 MV/m (pulsed) was observed at 4.2 K. After annealing, a low power Q_0 of 1.2 $\times 10^8$ was observed with small Q degradation due to field emission at high accelerating fields.

2197 (BNL–47325) **Concerning factors which determine whether flux-lattice shear or pin breaking limits the critical current density of superconductors.** Welch, D.O. Brookhaven National Lab., Upton, NY (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920802–23: Applied superconductivity conference, Chicago, IL (United States), 23-28 Aug 1992). Order Number DE93001653. Source: OSTI; NTIS; INIS; GPO Dep.

An elementary model is presented which illustrates the conditions under which flux-lattice shear, rather than pin breaking, limits the critical current density. An expression for the shear strength of the flux-lattice, based on the plasticity of metals and alloys, is used to derive the critical current density, including the effect of thermal activation in the flux creep regime.

2198 (CEA-CONF–10984) **Application of superconductivity for large equipments in physics.** Kircher, F. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Astrophysique, de la Physique des Particules, de la Physique Nucleaire et de l'Instrumentation Associee. 1992. 8p. (In French). (CONF-9203199–: Meeting on Technology, Paris (France), 24-25 Mar 1992). Order Number DE93721047. Source: OSTI; NTIS (US Sales Only); INIS.

Performance and applications of superconducting cavities and superconducting magnets, using liquid or superfluid helium, are reviewed.

2199 (CEA-CONF–10986) **Conceptual design of the CMS 4 Tesla solenoid.** Baze, J.M.; Desportes, H.; Duthil, R.; Lesmond, C.; Lottin, J.C.; Pabot, Y. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Astrophysique, de la Physique des Particules, de la Physique Nucleaire et de l'Instrumentation Associee. Feb 1992. 15p. (CONF-9203195–: Proceedings of the General Meeting on LHC Physics and Detectors, Evian (France), 5-8 Mar 1992). Order Number DE93721048. Source: OSTI; NTIS (US Sales Only); INIS.

A large and important meeting 'Toward the LHC experimental programme' is due to be held at EVIAN-les-BAINS, on 5-8 March 1992. The major goal accurate measurement of muon momenta makes necessary, for the detectors, the use of large and powerful magnetic system producing high bending power. The CMS experiment is based on a solenoidal magnetic configuration. It has been designed to produce a high magnetic induction (4 T) in a 14 m long, 5.9 m bore cylindrical volume surrounding the interaction point. The diameter has been fixed to the maximum dimension compatible with road transportation to CERN. This long solenoid with its 12 500 ton iron yoke is a fully shielded magnet. The paper presents the conceptual design of the superconducting coil and its technical characteristics.

2200 (CEA-CONF–10987) **New devices for the magnetic center location of quadrupole magnets.** Le Bars, J.; Kircher, F. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Astrophysique, de la Physique des Particules, de la Physique Nucleaire et de l'Instrumentation Associee. Mar 1992. 3p. (CONF-920315–: 3. European particle accelerator conference, Berlin (Germany), 24-28 Mar 1992). Order Number DE93721049. Source: OSTI; NTIS (US Sales Only); INIS.

A system is presently under development at SACLAY for determining the location of the magnetic center of superconducting quadrupole magnets. It uses magnetic crystals in garnet film form, with visualization of the results by an optical method. This paper will describe the sensors, the measuring methods and the results which have been obtained so far, they are quite encouraging for long superconducting quadrupoles, for which the classical mechanical methods have reached their limits.

2201 (CONF-920802–14) **Investigating thermal hydraulic quenchback in a cable-in-conduit superconductor.** Lue, J.W.; Dresner, L.; Schwenterly, S.W.; Wilson, C.T.; Lubell, M.S. Oak Ridge National Lab., TN (United States). [1992]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. From Applied superconductivity conference; Chicago, IL (United States); 23-28 Aug 1992. Order Number DE92040864. Source: OSTI; NTIS; GPO Dep.

Quench propagation of a cable-in-conduit force-cooled superconductor plays a very important role in the protection of a magnet built with such a conductor as in a Superconducting Magnetic Energy Storage (SMES) system. Some thermal analysis showed that the compressional and frictional heating exerted by the expanding hot helium could heat the helium away from the normal zone above the superconductor current sharing temperature. Thus an acceleration of the quench propagation could be realized. This phenomenon was termed thermal hydraulic quenchback (THQ). A setup has been built specifically to investigate this phenomenon. The test sample consists of a 50-m-long NbTi superconducting cable enclosed in a stainless steel conduit. Heaters 0.2 to 8 m long are provided to quench the conductor. This paper reports experimental finding of THQ and its dependence on the initial normal zone length, the conductor current, and the temperature.

2202 (DOE/ER/13335–1) **Cryotribology: Development of cryotribological theories and application to cryogenic devices: Interim report, June 15, 1985–August 31, 1992.** Iwasa, Y. (Massachusetts Inst. of Tech., Cambridge, MA (United States)); Michael, P.; Rabinowicz, E. Massachusetts Inst. of Tech., Cambridge, MA (United States). 15 Sep 1992. 232p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER13335. Order Number DE93000404. Source: OSTI; NTIS; GPO Dep.

High-performance superconducting solenoids are susceptible to premature quenches, or superconducting to normal state transitions, due to abrupt conductor movements within the winding. Abrupt motions involving 5~10μm conductor displacements dissipate sufficient energy to trigger a quench. Sliding and mechanical behaviors of materials at cryogenic temperatures have been experimentally examined. After accounting for changes in the sliding materials' low-temperature strength properties, we have found that the adhesion theory of friction and wear remains applicable at cryogenic temperatures. The adhesion friction theory suggests two methods for controlling unsteady sliding motions. The first involves the selection of sliding materials whose friction coefficients increase with increasing sliding speed. A number of material pairs have been examined for positive friction-velocity characteristics. This materials-based approach to frictional stabilization does not seem a viable option at 4.2 K. The second alternative is to preprogram the force conditions within high-risk regions of the winding to regulate the occurrence of unsteady sliding motions. Structural models are proposed to account for unsteady conductor motions on a variety of dimensional scales. The models are used to design a small superconducting solenoid. Performance of this solenoid suggests that force-based motion control is a potentially viable design approach for achieving successful dry-wound magnets.

Source: OSTI; NTIS (US Sales Only); INIS.

We describe the continuum field-theoretical formulation for the new superconductors. The aspects related with topological excitations and generalized statistics are emphasized. A tentative description of doping is made and and a possible mechanism of superconductivity is conjectured. (author).

Inst. Yadernoj Fiziki. 1991. 16p. Order Number DE93606387. Source: OSTI; NTIS (US Sales Only); INIS.

Two-dimensional t-J model equivalent at $t>J$ to the Hubbard model is considered by the variational method. The compact anzats are proposed for the mobile hole wave function. The dispersion of this holes on the Neel and RVB background is calculated. It is shown that the doping induces transition from the Neel state to the spin-liquid RVB state. At $I\leq t/J\leq 4$ the transition point is at hole concentration $x\approx 0.1$. 22 refs.; 2 tabs.

The values of the superconducting penetration depth measured on thin and thick niobium films are presented. The obtained values of s.p.d. in our experiments at T=4.9 K are 145(+/-15) nm for a thin film and 90 (+/-) nm for a thick film. It is essentially different from that one for bulk niobium. 4 refs.; 1 fig.

Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1990. 11p. Order Number DE93606389. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Physica B plus C.

The 80 K superconductor $Bi_2(Sr, Ca)_3Cu_2O_{8+\gamma}$ was investigated at room and low temperatures by the single-crystal neutron diffraction and at elevated temperatures by the powder diffraction. The 4.75a modulation and excess of oxygen (γ=0.21 in the ideal case) persist over all the temperature range without marked changes. Complete structural refinement at 90 K and 55 K revealed only small changes with respect to the room-temperature structure. Essentially, the cation-oxygen distances which are considered as bonding are retained while some nonbonding ones decrease. The bonding of copper within the CuO_2 layer remains nearly planar in distinction to the related 93 K superconductor $YBa_2Cu_3O_7$ in which the copper cations are substantially shifted out of the oxygen plane. 7 refs.; 2 figs.; 1 tab.

The absorption infrared spectra measurements in superconducting metaoxides $YBa_2Cu_3O_{7-\sigma}$ in the dynamic range wave of 0.25-25 μm are given. The influence of the etching samples on the absorption spectra has been studied. 5 refs.; 5 figs.; 1 tab.

2226 (KAERI/RR–1020/90) **A study on the development of high-Tc superconducting wire.** Won, Dong Yeon (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Lee, Hee Gyoun; Kim, Chan Joong. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Sep 1991. 194p. (In Korean). Order Number DE93606393. Source: OSTI; NTIS (US Sales Only); INIS.

High magnetization YBaCuO superconductor was prepared with additions of $BaSnO_3$, SnO_2 and SiC by partial melt processing. Addition of $BaSnO_3$ increased the magnetic property of YBaCuO by flux pinning action of finely dispersed $BaSnO_3$ particles, while addition of SnO_2 decreased the magnetic property, because the size of particle was larger than that of $BaSnO_3$. BiPbSrCaCuO superconducting tape of single filament was prepared by powder-in-tube method using silver as a shearth material. The fabrication techniques involves powder packing, swaging, drawing and cold rolling/pressing method. The final dimension of wire after drawing is 1.2mm diameter. The wire was pressed into a tape form with a thickness of 70micron and a width of 3mm. The obtained critical current density of the prepared tape was 2000A/cm^2 at 77K. (Author).

Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1992. 89p. (In Korean). Order Number DE93606394. Source: OSTI; NTIS (US Sales Only); INIS.

The major work of this project aims to develop the frictionless superconducting bearing with a high speed. The high magnetization YBaCuO bulk superconductor was prepared by Quasi-melt process. The frictionless superconducting magnetic bearing standed a rotating bar with a speed of 75,000 rpm, which were operated by an electric controller. The low temperature chemical vapor deposition technique was developed. YBaCuO superconducting film showing a superconductivity above 77K was successfully prepared at 650 deg C. Effect of oxygen partial pressure, substrate, deposition temperature on the film properties were also investigated. (Author).

2228 (LA-UR-92-3055) **Three-terminal devices of high-T_c superconductors: A status report and future challenges.** Kung, Pang-Jen (Los Alamos National Lab., NM (United States)). Los Alamos National Lab., NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920802–15: Applied superconductivity conference, Chicago, IL (United States), 23-28 Aug 1992). Order Number DE93000654. Source: OSTI; NTIS; INIS; GPO Dep.

A study has been conducted on the recent progress of the three-terminal devices with transistor-like characteristics fabricated from the high-T_c superconducting materials. This study explored the operating principles and characteristics of these devices in relation to the relevant materials and techniques. A comparison of a variety of techniques for superconducting thin film deposition will be given. This study indirates that the feasibility of fabricating hybrid devices composed of semiconductors and superconductors appear to be the key issue to push forward the applications of high-T_c superconductors in microelectronics. The junction field-effect transistors with a semiconductor base controlled by the proximity effect are likely to be more manufacturable. The factors that influence the operating reliability of devices and the problems arising from integrating and packaging the devices will also be discussed.

(Universidade Federal Fluminense, Niteroi, RJ (Brazil)); Porras M, N.; Oliveira, L.E. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. PHOTOLUMINESCENCE/impurities; ELECTRON GAS; FERMI LEVEL; GALLIUM ARSENIDES; PHOTOLUMINESCENCE; IMPURITIES; TEMPERATURE DEPENDENCE; VARIATIONAL METHODS; WIRES

2251 (INIS-BR–2933, pp. 337) **Cyclotron resonance in GaAs-GaSb heterojunction: effect of interfacial electron-phonon coupling.** Osorio, F.A.P. (Goias Univ., Goiania, GO (Brazil). Dept. de Fisica); Hipolito, O. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. HETEROJUNCTIONS/electron-phonon coupling; ANTIMONY COMPOUNDS; CYCLOTRON RESONANCE; GALLIUM ARSENIDES; HETEROJUNCTIONS

2252 (INIS-BR–2933, pp. 337) **Effects of electric field on transmission coefficient of non-abrupt GaAs/$Ga_{1-x}Al_xAs$ heterojunction.** Auto, M.M. (Ceara Univ., Fortaleza, CE (Brazil)); Farias, G.A.; Freire, V.N. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. HETEROJUNCTIONS/electric fields; ALUMINIUM COMPOUNDS; GALLIUM ARSENIDES; HETEROJUNCTIONS; INTERFACES; QUANTITY RATIO; RESONANCE; TRANSMISSION

2253 (INIS-BR–2933, pp. 338) **Light scattering in quantum-well semiconductors.** Costa, C.R. (Brasilia Univ., DF (Brazil). Dept. de Fisica); Morais, P.C.; Nunes, A.C. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. INELASTIC SCATTERING/photons; PHOTONS; PERTURBATION THEORY; PHONONS; SEMICONDUCTOR DEVICES

2254 (INIS-BR–2933, pp. 338) **Study on electronic structure of silicon using large unit cell approximation.** Waki, P.S. (Escola Federal de Engenharia de Itajuba, MG (Brazil)); Pereira Neto, J.R. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. SILICON/electronic structure; GROUP THEORY; IMPURITIES; SEMICONDUCTOR MATERIALS; SILICON; WAVE FUNCTIONS

2255 (INIS-BR–2933, pp. 339) **Optical and electrical properties of δ-doped in GaAs growth by molecular beam epitaxy.** Notari, A.C. (Sao Paulo Univ., Sao Carlos, SP (Brazil). Inst. de Fisica e Quimica); Schrappe, B.; Basmaji, P.; Li, M.S.; Hipolito, O.; Bernussi, A.A. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. CRYSTAL DOPING/electrical properties; CRYSTAL GROWTH; EPITAXY; GALLIUM ARSENIDES; INDIUM COMPOUNDS; OPTICAL PROPERTIES; SPECTROSCOPY

2256 (INIS-BR–2933, pp. 339) **Results of photomodulated spectroscopy in superlattices and quantum wells of $In_xGa_{1-x}As/GaAs$.** Ribeiro, E. (Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica); Cerdeira, F.; Motisuke, P.; Vazquez-Lopez, C.; Sacilotti, M.A.; Roth, A.P. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. SUPERLATTICES/spectroscopy; GALLIUM ARSENIDES; INDIUM COMPOUNDS; QUANTITY RATIO; SUPERLATTICES; SPECTROSCOPY

2257 (INIS-BR–2933, pp. 339) **States of Yb impurities in semiconducting III-V crystals.** Macedo, T.C.A. (UNESP, Guaratingueta, SP (Brazil). Faculdade de Engenharia); Nery, S.M. del; Rangel, E.C.; Ikeda, L.H. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. YTTERBIUM/impurities; CRYSTAL FIELD; ELECTRONIC STRUCTURE; GALLIUM ARSENIDES; INDIUM PHOSPHIDES; MULTIPLE SCATTERING; X-RAY DIFFRACTION; YTTERBIUM; IMPURITIES

2258 (INIS-BR–2933, pp. 346) **Dynamics in anisotropic antiferromagnets.** Majlis, N. (Universidade Federal Fluminense, Niteroi, RJ (Brazil). Inst. de Fisica); Selzer, S.; Strinati, G. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. ANTIFERROMAGNETIC MATERIALS/anisotropy; ANISOTROPY; GREEN FUNCTION; MAGNETIC MOMENTS; NEEL TEMPERATURE; RANDOM PHASE APPROXIMATION; SUPERCONDUCTORS

2259 (INIS-BR–2933, pp. 347) **Elastic properties of vortice lattices in layer structure superconductors.** Carneiro, G. (Pontificia Univ. Catolica do Rio de Janeiro, RJ (Brazil). Dept. de Fisica). Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. SUPERCONDUCTORS/elasticity; CRITICAL TEMPERATURE; LAYERS; LONDON EQUATION; SUPERCONDUCTORS; ELASTICITY

2260 (INIS-BR–2933, pp. 347) **Measurements of thermal diffusivity in polycrystal samples of $YBa_2Cu_3O-7_{-x}$ ($x \simeq 0,1$).** D'Azeredo Orlando, M.T. (Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil)); Gomes, L.; Rossi, W. de; Vieira, M.M.F.; Jorge, M.P.P.; Grigoletto, T.; Martinez, L.G.; Morato, S.P. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. POLYCRYSTALS/thermal diffusivity; BARIUM; CERAMICS; COPPER OXIDES; ELECTRIC

CONDUCTIVITY; MAGNETIC SUSCEPTIBILITY; POLYCRYSTALS; STOICHIOMETRY; X-RAY DIFFRACTION; YTTRIUM

2261 (INIS-BR–2933, pp. 348) **Microwave absorption in oriented superconducting samples.** Melo, M.T. de (Pernambuco Univ., Recife, PE (Brazil). Dept. de Fisica); Ferreira, J.M. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. MICROWAVE RADIATION/absorption; MICROWAVE RADIATION/superconductors; BARIUM; COPPER OXIDES; CRITICAL TEMPERATURE; GRAIN ORIENTATION; ABSORPTION; SUPERCONDUCTORS; RARE EARTHS; TEMPERATURE DEPENDENCE

2262 (INIS-BR–2933, pp. 349) **Influence of microstructure on irreversibility curve of $YBa_2Cu_3O_{7-\delta}$.** Andrade Junior, R. de (Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica); Campos, S.P. de; Avila, M.A.; Lima, O.F. de. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. SUPERCONDUCTORS/microstructure; BARIUM; COPPER OXIDES; CRITICAL TEMPERATURE; IRREVERSIBLE PROCESSES; PHASE DIAGRAMS; SPIN GLASS STATE; SUPERCONDUCTORS; MICROSTRUCTURE; YTTRIUM

2263 (INIS-BR–2933, pp. 350) **Conductance in high T_c compounds.** Lagos, R.E. (Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica). Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. SUPERCONDUCTING COMPOSITES/critical temperature; BARIUM; COPPER OXIDES; ELECTRIC CONDUCTIVITY; LANTHANUM; YTTRIUM

2264 (INIS-BR–2933, pp. 350) **Influence of oxygen concentration on irreversibility curve of BI (2122) monocrystals.** Moehlecke, S. (Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica); Torikachvili, M.S. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. MONOCRYSTALS/magnetization; BISMUTH; CALCIUM; COPPER OXIDES; IRREVERSIBLE PROCESSES; MONOCRYSTALS; MAGNETIZATION; OXYGEN; QUANTITY RATIO; STRONTIUM; TEMPERATURE DEPENDENCE

2265 (INIS-BR–2933, pp. 350) **Electronic structure and optical spectra of $YBa_2Cu_{3-x}M_xO_{7-\delta}$ superconductor.** Lima, G.A.R. (Sao Paulo Univ., SP (Brazil). Inst. de Fisica); Mota, R.; Fazzio, A. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. SUPERCONDUCTORS/electronic structure; BARIUM; CONFIGURATION INTERACTION; COPPER OXIDES; ELECTRON CORRELATION; EXCITATION; SUPERCONDUCTORS; YTTRIUM

2266 (INIS-BR–2933, pp. 351) **Pair formation and Bose condensation in square lattice.** Mello, E.V.L. de (Universidade Federal Fluminense, Niteroi, RJ (Brazil). Dept. de Fisica). Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. BOSE-EINSTEIN CONDENSATION/square configuration; BOUND STATE; CRITICAL TEMPERATURE; CRYSTAL LATTICES; SPIN; SUPERCONDUCTORS

2267 (INIS-BR–2933, pp. 356) **Hysteretic losses in NbTi superconducting wires.** Ramos, M.J. (Fundacao de Tecnologia Industrial (FTI), Lorena, SP (Brazil). Centro de Materiais Refratarios); Shigue, C.Y. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. SUPERCONDUCTING WIRES/hysteresis; MAGNETIC FIELDS; MAGNETIZATION; NIOBIUM; QUANTITY RATIO; HYSTERESIS; TITANIUM

2268 (INIS-BR–2933, pp. 369) **Relaxation of Fermi level on interface formation.** Souza, F.J.O. de (Pernambuco Univ., Recife, PE (Brazil). Dept. de Fisica); Melo, C.P. de. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. FERMI LEVEL/relaxation; CHARGE CONSERVATION; ELECTRONIC STRUCTURE; RELAXATION; INTERFACES; ONE-DIMENSIONAL CALCULATIONS; TRANSFER MATRIX METHOD

2269 (INIS-BR–2933, pp. 370) **Theory on monolayer magnetic properties of transition metals at finite temperature.** Pini, M.G. (Consiglio Nazionale delle Ricerche, Florence (Italy). Ist. di Elettronica Quantistica); Rettori, A.; Pescia, D.; Majlis, N.; Selzer, S. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. LAYERS/magnetic properties; HAMILTONIANS; LAYERS; RENORMALIZATION; TEMPERATURE DEPENDENCE; TRANSITION ELEMENTS; TWO-DIMENSIONAL CALCULATIONS

2270 (INIS-BR–2933, pp. 373) **Automatic determination of film parameters by transmission spectrum.** Silva, F.C. da (Pontificia Univ. Catolica do Rio de Janeiro, RJ (Brazil)); Nunes, R.A.; Carmo, L.C.S.; Paciornik, S.; Souza Camargo Junior, S.A. de. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. THIN FILMS/interfaces; ABSORPTION; REFRACTIVITY; SPECTROPHOTOMETERS; THICKNESS; INTERFACES

2271 (INIS-BR–2933, pp. 314) **Excitonic optical transitions in strained heterostructures.** Cohen, A.M. (Amazonas Univ., Manaus, AM (Brazil). Dept. de Fisica); Aladim, S.R.; Marques, G.E. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. HETEROJUNCTIONS/ absorption spectra; EIGENSTATES; HETEROJUNCTIONS; HYBRIDIZATION; OSCILLATOR STRENGTHS; STRAINS

2272 (INIS-BR–2933, pp. 315) **Photoluminescence of a-Ge:H.** Marcano, G. (Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica); Chambouleyron, I. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. THIN FILMS/ photoluminescence; CRYSTAL GROWTH; GERMANIUM; LINE WIDTHS; SPUTTERING; PHOTOLUMINESCENCE

2273 (INIS-BR–2933, pp. 315) **Pressure and composition effects on gap properties of $Al_xGa_{e-x}As$.** Capaz, R.B. (Pontificia Univ. Catolica do Rio de Janeiro, RJ (Brazil). Dept. de Fisica); Koiller, B.; Weid, J.P. von der. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. ENERGY GAP/pressure dependence; GALLIUM ARSENIDES/energy gap; ALUMINIUM COMPOUNDS; BOUNDARY CONDITIONS; HAMILTONIANS; QUANTITY RATIO

2274 (INIS-BR–2933, pp. 316) **A self-consistent calculation of electronic and transport properties of a semiconductor microchannel.** Anda, E.V. (Universidade Federal Fluminense, Niteroi, RJ (Brazil). Inst. de Fisica); Makler, S.S.; Pernas, P.L.; Flores, F. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. SEMICONDUCTOR DEVICES/ electrical properties; ELECTRIC FIELDS; HAMILTONIANS; KUBO FORMULA; SELF-CONSISTENT FIELD; TRANSPORT

2275 (INIS-BR–2933, pp. 316) **Determination of Auger recombination coefficient in semiconductors II-VI.** Cruz, J.M.R. (Brasilia Univ., DF (Brazil). Dept. de Fisica); Driel, H.M. van. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. CADMIUM SELENIDES/auger effect; CARRIER DENSITY; ELECTRON-MESON INTERACTIONS; EXCITATION; SEMICONDUCTOR MATERIALS

2276 (INIS-BR–2933, pp. 316) **Photoluminescence of the $Ga_{1-x}Al_xAs$:si confining layer of doped asymmetrically quantum wells (SAQW) growth by MBE.** Mendes, W.M. (Pontificia Univ. Catolica do Rio de Janeiro, RJ (Brazil)); Weid, J.P. von der; Souza, P.L.; Dias, I.F.L. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. PHOTOLUMINESCENCE/ crystal doping; ACTIVATION ENERGY; ALUMINIUM COMPOUNDS; CRYSTAL GROWTH; ENERGY GAP; GALLIUM ARSENIDES; LAYERS; PHOTOLUMINESCENCE

2277 (INIS-BR–2933, pp. 317) **The influence of the initial quasi-equilibrium temperature of phonons on dynamic of photoexcited hot carriers.** Maia, A.E.P. (Ceara Univ., Fortaleza, CE (Brazil). Dept. de Fisica); Freire, V.N. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. ELECTRON-PHONON COUPLING/temperature dependence; CARRIERS; DYNAMICS; NUMERICAL SOLUTION; PHONONS; TIME DEPENDENCE

2278 (INIS-BR–2933, pp. 317) **Transport transients in intense fields of multi-valley GaAs by using a phenomenological model.** Alencar, A.M. (Ceara Univ., Fortaleza, CE (Brazil). Dept. de Fisica); Freire, V.N.; Costa, J.A.P. da. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. ELECTRONS/transport; ELECTRIC FIELDS; ELECTRONS; TRANSPORT; GALLIUM ARSENIDES; MOMENTS METHOD; MONTE CARLO METHOD; RELAXATION TIME; STEADY-STATE CONDITIONS; TIME DEPENDENCE; TRANSIENTS; VELOCITY

2279 (INIS-BR–2933, pp. 332) **Shielding of electron-phonon interaction in polar semiconductors.** Costa, W.B. da (Sao Paulo Univ., Sao Carlos, SP (Brazil). Inst. de Fisica e Quimica); Studart, N. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). In *Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2.* Order Number DE93604743. Source: OSTI; NTIS (US Sales Only); INIS.

Published in summary form only. ELECTRON-PHONON COUPLING/shielding; BINDING ENERGY; CANONICAL TRANSFORMATIONS; EFFECTIVE MASS; ELECTRON GAS; SHIELDING; HAMILTONIANS; PERTURBATION THEORY; POLARONS; STRUCTURE FACTORS; VARIATIONAL METHODS

2280 (INIS-BR–2933, pp. 319) **Models for semiconductor defects.** Baierle, R. (Sao Paulo Univ., SP (Brazil). Inst. de Fisica); Caldas, M.J. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). 2305 (CONF-920142–2) **Tokamak turbulence in self-regulated differentially rotating flow and L-H transition dynamics.** Terry, P.W. (Wisconsin Univ., Madison, WI (United

States). Dept. of Physics); Diamond, P.H.; Carreras, B.A.; Sidikman, K. Oak Ridge National Lab., TN (United States). [1992]. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;FG02-89ER53291. From International topical conference on new ideas in tokamak confinement; La Jolla, CA (United States); 27-29 Jan 1992. Order Number DE93000443. Source: OSTI; NTIS; INIS; GPO Dep.

An analytical study of turbulence in the presence of turbulently generated differentially rotating flow is presented as a paradigm for fluctuation dynamics in L- and H-mode plasmas. Using a drift wave model, the role of both flow shear and flow curvature (second radial derivative of the poloidal ExB flow) is detailed in linear and saturated turbulence phases. In the strong turbulence saturated state, finite amplitude-induced modification of the fluctuation structure near low order rational surfaces strongly inhibits flow shear suppression. Suppression by curvature is not diminished, but it occurs through a frequency shift. A description of L-H mode transition dynamics based on the self-consistent linking of turbulence suppression by differentially rotating flow and generation of flow by turbulent momentum transport is presented. In this model, rising edge temperature triggers a transition characterized by spontaneous generation of differentially rotating flow and decreasing turbulence intensity.

2306 (CONF-920913–4) **Fluctuation studies of ECH plasmas in the ATF torsatron and the IMS stellarator.** Harris, J.H. (Oak Ridge National Lab., TN (United States)); Wilgen, J.B.; Murakami, M.; Baylor, L.R.; Bigelow, T.S.; Colchin, R.J.; Dory, R.A.; Dominguez, N.; Dunlap, J.L.; Dyer, G.R.; England, A.C.; Isler, R.C.; Jernigan, T.C.; Lyon, J.F.; Ma, C.H.; MioduOak Ridge National Lab., TN (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 14. international conference on plasma physics and controlled nuclear fusion research; Wuerzburg (Germany); 30 Sep - 7 oct 1992. Order Number DE93001204. Source: OSTI; NTIS; INIS; GPO Dep.

The results of experimental studies of fluctuations and transport in ECH plasmas in the ATF torsatron and the IMS stellarator are presented. In ATF, a variety of diagnostics have been used to measure turbulence amplitudes and spectral characteristics throughout the plasma. In the plasma core, density fluctuations with characteristics like those expected for drift waves (possibly connected with trapped electron effects) are seen. In the gradient region, the density fluctuation levels are consistent with those expected for resistive interchange turbulence. In the edge, fluctuations appear to be correlated with density gradients, and the fluctuation-induced particle flux and global particle confinement can be influenced by positive limiter biasing. In IMS, whose parameters model those in the edge of larger devices, two-dimensional (2-D) probe measurements show substantial poloidal variations in the fluctuation-induced particle flux that are most pronounced at the plasma edge; as in ATF, the particle flux can be reduced by positive limiter biasing. The 2-D probe measurements also show good agreement between the plasma poloidal flow velocities determined from the Reynolds stress and force balance.

2307 (CONF-921217–1-Extd.Abst.) **Calibration of an infrared polarimeter for Alcator C-Mod.** Ma, C.H. (Oak Ridge National Lab., TN (United States)); Hutchinson, D.P.; Irby, J. Oak Ridge National Lab., TN (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 17. annual SPIE international conference on infrared and millimeter wave sources; Pasadena, CA (United States); 14-18 Dec 1992. Order Number DE92041308. Source: OSTI; NTIS; INIS; GPO Dep.

An infrared polarimeter system for measurement of the plasma current density in Alcator C-Mod tokamak has been fabricated and tested. The system utilizes a cw CO_2 laser at a wavelength of 10.6 μm. Polarization-modulation techniques have been used to achieve the high sensitivity required for the measurement. The preliminary results of a feasibility study of the system for the International Thermonuclear Experimental Reactor (ITER) are also presented.

2308 (CTH-IEFT-PP–1992-06) **Orbit losses of strongly ICRF-heated ions.** Anderson, A.; Dillner, Oe.; Lisak, M. Chalmers Univ. of Technology, Goeteborg (Sweden). Inst. for Electromagnetic Field Theory and Plasma Physics. 1992. 14p. Order Number DE93606269. Source: OSTI; NTIS; INIS.

An approximate analytical investigation is made to assess the importance of orbit losses of strongly ICRF-heated minority ions. Explicit expressions for the fraction of lost minority ions are derived and shown to be in good agreement with numerical simulation results. The results indicate that present day ICRF heating power density levels cannot be raised significantly without causing important particle and energy losses due to unconfined particle orbits. 6 refs., 5 figs.

2309 (CTH-IEFT-PP–1992-10) **Simulation of a coupled dynamic system of temperature and density in a fusion plasma.** Le Roux, M.N. (Centre de Recherche en Mathematiques, Universite de Bordeaux I, Talance Cedex (France)); Weiland, J.; Wilhelmsson, H. Chalmers Univ. of Technology, Goeteborg (Sweden). Inst. for Electromagnetic Field Theory and Plasma Physics. [1992]. 32p. Order Number DE93606236. Source: OSTI; NTIS; INIS.

Simulation studies of a coupled system of equations for the evolution of temperature and density have been performed. The results are presented in graphs displaying the evolution in time of the temperature and density profiles, as well as in phase-plane plots, relating the central values of temperature and density. Particular emphasis is devoted to the particle and heat pinch effects, which tend to counter-balance the ordinary diffusion, and to co-operate with the alpha particle heating in sustaining plasma equilibrium. Oscillatory approaches to equilibria are recorded. 28 refs., 20 figs.

2310 (CTH-IEFT-PP–1992-12) **Effect of sawteeth on alpha power deposition and ignition in Tokamaks.** Kolesnichenko, Ya.I. (Inst. for Nuclear Research of the Academy of Sciences, Kiev (Ukraine) and Chalmers Univ. of Technology, Goeteborg (Sweden). Inst. for Electromagnetic Field Theory and Plasma Physics); Lutsenko, V.V.; Yakovenko, Yu.V. Chalmers Univ. of Technology, Goeteborg (Sweden). Inst. for Electromagnetic Field Theory and Plasma Physics. [1992]. 26p. Order Number DE93606270. Source: OSTI; NTIS; INIS.

The main features of the alpha particle heating, ignition and thermonuclear burn in a tokamak plasma with sawtooth oscillations are revealed. The sensitivity of results against the various model of sawteeth and characteristics of the safety factor q(r) is investigated. Analysis of ignition is best applicable to the case $T_\epsilon < T_r, T_\epsilon$ being the alpha particle energy loss time, T_r period of sawtooth oscillations.

2311 (DOE/ER/51124–7) **High beta and second stability region transport and stability analysis: Final report.** Hughes, M.H.; Phillps, M.W.; Todd, A.M.M.; Krishnaswami, J.; Hartley, R. Grumman Corp., Princeton, NJ (United States). Sep 1992. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER51124. Order Number DE93000886. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes ideal and resistive studies of high-beta plasmas and of the second stability region. Emphasis is focused on "supershot" plasmas in TFIR where MHD instabilities are frequently observed and which spoil their confinement properties. Substantial results are described from the analysis of these high beta poloidal plasmas. During these studies, initial pressure and safety factor profiles were obtained from the TRANSP code, which is used extensively to analyze experimental data. Resistive MBD stability studies of supershot equilibria show that finite pressure stabilization of tearing modes is very strong in these high βp plasmas. This has prompted a detailed re-examination of linear tearing mode theory in which we participated in collaboration with Columbia University and General Atomics. This finite pressure effect is shown to be highly sensitive to small scale details of the pressure profile. Even when an ad hoc method of removing this stabilizing mechanism is implemented, however, it is shown that there is only superficial agreement between resistive MBD stability computation and the experimental data. While the mode structures observed experimentally can be found computationally, there is no convincing correlation with the experimental observations when the computed results are compared with a large set of supershot data. We also describe both the ideal and resistive stability properties of TFIR equilibria near the transition to the second region. It is shown

that the highest β plasmas, although stable to infinite-n ideal ballooning modes, can be unstable to the so called "infernal" modes associated with small shear. The sensitivity of these results to the assumed pressure and current density profiles is discussed. Finally, we describe results from two collaborative studies with PPPL. The first involves exploratory studies of the role of the 1/1 mode in tokamaks and, secondly, a study of sawtooth stabilization using ICRF.

2312 (DOE/ER/53198–199) **Plasma physics research in the MST toroidal confinement device: Progress report, November 1, 1991–June 15, 1992.** Wisconsin Univ., Madison, WI (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER53198. Order Number DE93000491. Source: OSTI; NTIS; INIS; GPO Dep.

Below is a brief project report covering the first 7-1/2 months of FY92. The report is composed of a list of projects divided into three categories. The first list of "completed physics projects" includes studies which have reached firm conclusions which have been or are being submitted for publication. The second list of "ongoing projects" are mostly physics tasks which are underway. the third list of "diagnostic development" tasks includes completed general-use machine diagnostics and special-purpose diagnostics under development. The division between the last two lists is somewhat arbitrary. The list of projects includes both major group efforts and low-level tasks. The weighting and personnel allocations are not indicated in this report.

2313 (DOE/ER/53225–2) **Studies of plasma confinement in linear and RACETRACK mirror configurations: Progress report, Task 4.** Kuthi, A.; Wong, A.Y. California Univ., Los Angeles, CA (United States). Dept. of Physics. 28 May 1989. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-86ER53225. Order Number DE93002522. Source: OSTI; NTIS; INIS; GPO Dep.

During the period from November 1988 through April 1989 the experimental plasma physics program at UCLA produced several new results. The experiments were conducted on the toroidal RACETRACK device. Generation of a steady-state high-beta field-reversed configuration in one of the straight sections by the rotating electromagnetic wave technique is now routine and because of understanding gained in the course of experiments we succeeded in extending the range of operation was extended. The pressure balance relation was verified by independent pressure and magnetic field measurements for this field reversed-configuration. Studies of the equilibrium have been extended to spatial and temporal decay of the confining diamagnetic current. It has been observed, that the current decays on the resistive time scale due to electron-ion coulomb collisions. Current injection was also used to study the effects of mirror fields on toroidal currents and to reduce the neutral gas pressure for a given plasma density.

2314 (DOE/ER/53225–T4) **Studies of plasma confinement in linear and RACETRACK mirror configurations: Progress report, January 1–October 31, 1986.** Kuthi, A.; Wong, A.Y. California Univ., Los Angeles, CA (United States). Dept. of Physics. 30 Jun 1986. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-86ER53225. Order Number DE93002529. Source: OSTI; NTIS; GPO Dep.

This report discusses research on the following magnetic mirror configurations: Racetrack; ECRH generated plasmas; RF generated plasmas; potential structures; surface multipole fields, and lamex; hot electron physics; axial loss processes; and RF induced effects.

2315 (DOE/ER/53225–T7) **[Magnetic fusion theory and experimental research and development]: Progress report, November 1, 1991–October 30, 1992.** California Univ., Los Angeles, CA (United States). School of Engineering and Applied Science. [1992]. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-86ER53225. Order Number DE93002539. Source: OSTI; NTIS; INIS; GPO Dep.

Radial currents have been used for generating plasma rotation. Particularly, oscillating torque experiments were performed. The resulting changes in the particle and heat transport were studied. Controlled variation in the poloidal asymmetry as well as in the plasma potential were induced by biasing. The particle confinement appears to be related to the sign of the radial electric potential. This is connected to the radial electric field and the direction of rotation. The electron diamagnetic drift direction is better. This corresponds to negative electric fields and potential. The poloidal asymmetry was studied in relation to heat confinement.

2316 (DOE/ER/53225–T8) **Applications of computer modeling to fusion research: Progress report, 1988–1989.** Dawson, J.M. California Univ., Los Angeles, CA (United States). Dept. of Physics. [1989]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-86ER53225. Order Number DE93002642. Source: OSTI; NTIS; INIS; GPO Dep.

Progress achieved during this report period is presented on the following topics: Development and application of gyrokinetic particle codes to tokamak transport, development of techniques to take advantage of parallel computers; model dynamo and bootstrap current drive; and in general maintain our broad-based program in basic plasma physics and computer modeling.

This report reviews work on the following plasma diagnostic techniques: beam emission spectroscopy and alpha-chers diagnostics. (LSP).

2319 (DOE/ER/54149–1) **Measurement of impurity ion densities and energies in the divertor and edge regions of Alcator C-Mod tokamak: Progress report, February 1, 1992–July 31, 1992.** Griem, H.R.; Moreno, J.; Welch, B.L. Maryland Univ., College Park, MD (United States). Lab. for Plasma Research. [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-92ER54149. Order Number DE92040510. Source: OSTI; NTIS; INIS; GPO Dep.

A study to investigate impurity production and transport in the divertor and edge regions of the Alcator C-Mod tokamak through spectroscopic techniques is described. A 0.75-meter Czerny-Turner spectrometer with a 1200-g/mm grating and a 35-meter quartz optic bundle transmission line were tested. A high-resolution 2-meter spectrometer will be ordered. Data acquisition considerations are being addressed. (RWR)

2320 (DOE/ET/53088–563) **Toroidal effects on drift wave turbulence.** LeBrun, M.J.; Tajima, T.; Gray, M.G.; Furnish, G.; Horton, W. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. 23 Sep 1992. 77p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States); JIFT Program; Science and Technology Agency, Tokyo (Japan). DOE Contract FG05-80ET53088. (IFSR–563). Order Number DE93000498. Source: OSTI; NTIS; INIS; GPO Dep.

The universal drift instability and other drift instabilities driven by density and temperature gradients in a toroidal system are investigated in both linear and nonlinear regimes via particle simulation. Runs in toroidal and cylindrical geometry show dramatic differences in plasma behavior, primarily due to the toroidicity-induced coupling of rational surfaces through the poloidal mode number m. In the toroidal system studied, the eigenmodes are seen to possess (i) an elongated, nearly global radial extent (ii) a higher growth rate than in the corresponding cylindrical system, (iii) an

eigenfrequency nearly constant with radius, (iv) a global temperature relaxation and enhancement of thermal heat conduction. Most importantly, the measured Xi shows an increase with radius and an absolute value on the order of that observed in experiment. On the basis of our observations, we argue that the increase in Xi with radius observed in experiment is caused by the global nature of heat convection in the presence of toroidicity-induced mode coupling.

2321 (DOE/ET/53088–564) **Particle simulation algorithms with short-range forces in MHD and fluid flow.** Cable, S.; Tajima, T.; Umegaki, K. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Jul 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–564). Order Number DE93000407. Source: OSTI; NTIS; INIS; GPO Dep.

Attempts are made to develop numerical algorithms for handling fluid flows involving liquids and liquid-gas mixtures. In these types of systems, the short-range intermolecular interactions are important enough to significantly alter behavior predicted on the basis of standard fluid mechanics and magnetohydrodynamics alone. We have constructed a particle-in-cell (PIC) code for the purpose of studying the effects of these interactions. Of the algorithms considered, the one which has been successfully implemented is based on a MHD particle code developed by Brunel et al. In the version presented here, short range forces are included in particle motion by, first, calculating the forces between individual particles and then, to prevent aliasing, interpolating these forces to the computational grid points, then interpolating the forces back to the particles. The code has been used to model a simple two-fluid Rayleigh-Taylor instability. Limitations to the accuracy of the code exist at short wavelengths, where the effects of the short-range forces would be expected to be most pronounced.

2322 (DOE/ET/53088–566) **Map model for nonlinear alpha particle interaction with toroidal Alfven waves.** Berk, H.L.; Breizman, B.N.; Ye, H. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Sep 1992. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–566). Order Number DE93001851. Source: OSTI; NTIS; INIS; GPO Dep.

A map model has been developed for studying the nonlinear interaction of alpha particles with the toroidal Alfven eigenmodes. The map is constructed by assuming a linear interaction during a single poloidal transit, which allows the study of the nonlinear interaction over many transits. By using this map, analytic expressions are obtained for the particle nonlinear bounce frequency, and the wave amplitude threshold for the onset of particle orbit stochasticity. The map model can also facilitate self-consistent simulations which incorporate the time variation of the waves.

2323 (DOE/ET/53088–567) **Particle simulations in toroidal geometry.** Aydemir, A.Y. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Sep 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–567;CONF-9206235–2: International Atomic Energy Agency (IAEA) technical committee meeting on advances in simulation and modeling of thermonuclear plasmas, Montreal (Canada), 15 Jun 1992). Order Number DE93000622. Source: OSTI; NTIS; INIS; GPO Dep.

A computational tool to be used in kinetic simulations of toroidal plasmas is being developed. The initial goal of the project is to develop an electrostatic gyrokinetic model for studying transport and stability problems in tokamaks. In this brief report, preliminary results from the early stages of this effort are presented.

2324 (DOE/ET/53088–568) **Electron-temperature-gradient-induced instability in tokamak scrape-off layers.** Berk, H.L. (Texas Univ., Austin, TX (United States). Inst. for Fusion Studies); Cohen, R.H.; Ryutov, D.D.; Tsidulko, Y.A.; Xu, X.Q. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Aug 1992. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088 ;W-7405-ENG-48 ;FG03-90ER54079. (IFSR–568). Order Number DE93000623. Source: OSTI; NTIS; INIS; GPO Dep.

An electron temperature instability driven by the Kunkel-Guillory sheath impedance, has been applied to the scrape-off layer of tokamaks. The formalism has been generalized to more fully account for parallel wavelength dynamics, to differentiate between electromagnetic and electrostatic perturbations and to account for particle recycling effects. It is conjectured that this conducting wall instability leads to edge fluctuations in tokamaks that produce scrape-off widths of many ion Larmor radii $\simeq$10. The predicted instability characteristics correlate somewhat with DIII-D edge fluctuation data, and the scrape-off layer width in the DIII-D experiment agrees with theoretical estimates that can be derived from mixing lenght theory.

2325 (DOE/ET/53088–570) **Correlation theory of a two-dimensional plasma turbulence with shear flow.** Zhang, Y.Z.; Mahajan, S.M. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Sep 1992. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–570). Order Number DE93000880. Source: OSTI; NTIS; INIS; GPO Dep.

When the ion sound effect is neglected, a wide class of electrostatic plasma turbulence can be modelled by a two-dimensional equation for the generalized exstrophy Ψ, an inviscid constant of motion along the turbulent orbits. Under the assumption of a Gaussian stochastic electrostatic potential, an averaged Green's function method is used to rigorously derive equations for the N-particle correlation functions for a dissipative and sheared flow. This approach is equivalent to the cumulant expansion method used to study the Vlasov-Poisson system. For various cases of interest, appropriate equations are solved to obtain the absolute level as well as the detailed structure of the two-point correlation function C(r), and its Fourier transform, the exstrophy spectral function I(k). Uniformly valid analytical expressions are derived for the dissipative but shearless case resulting in a 'fluctuation-dissipation' theorem relating the total spectral intensity to classical viscosity. These self-consistent results show a strong logarithmic modification of the mixing length estimates for the turbulence levels.

2326 (DOE/ET/53088–573) **Multiple-gap theory of toroidal Alfven waves with kinetic effects.** Zhang, X.D.; Zhang, Y.Z.; Mahajan, S.M. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Sep 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–573). Order Number DE93001852. Source: OSTI; NTIS; INIS; GPO Dep.

The stability of kinetic toroidal Alfven waves with multi-gap coupling is analyzed by using the two-dimensional ballooning transform. An alternate convergence scheme, based on the smallness of the inverse aspect ratio, is devised. The resulting wave functions are oscillatory and do not balloon in contrast to the wave functions of conventional ballooning theory. It is shown that the single-gap theory is a special, weak shear ($s \rightarrow 0$) limit of the formalism. Analytical and numerical results for the two fundamental branches, the ideal toroidal Alfven eigenmode (TAE), and the kinetic toroidal Alfven eigenmode (KTAE) are presented and discussed.

2327 (DOE/ET/53088–575) **A self-consistent turbulence generated scenario for L-H transition.** Zhang, Y.Z.; Mahajan, S.M. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Oct 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–575). Order Number DE93001853. Source: OSTI; NTIS; INIS; GPO Dep.

The turbulence-induced ion banana polarization current associated with steep ion temperature gradients is explored as a possible mechanism for generating poloidal momentum at the tokamak edge. In the light of a recently developed two-dimensional turbulence theory, one can obtain a simple closed expression relating this current (determined by turbulence levels) to the derivatives of the poloidal rotation speed. A self-consistent system, then, emerges, if we balance the turbulence-induced poloidal momentum with that dissipated by viscosity. Under suitable conditions this system may show a bifurcation controlled by a parameter dependent on temperature gradients. Both the bifurcation point, and the shear layer width are predicted for a prescribed flow in terms of a scale characterizing the nonlinearity of viscosity. The crucial relevance of the flow parity with the turbulence scenario is analyzed.

2328 (EUR-CEA-FC–1453) **Localised measurements of turbulence in the Tore Supra tokamak.** Devynck, P. (Association

Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee); Garbet, X.; Laviron, C.; Payan, J.; Saha, S.K.; Gervais, F.; Hennequin, P.; Quemeneur, A.; Truc, A. Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. Apr 1992. 30p. Source: OSTI; NTIS (US Sales Only); INIS.

A collective infra-red laser scattering diagnostic has been installed on the TORE SUPRA tokamak for the measurement of plasma density fluctuations. For the range of wave numbers explored (3-15 cm^{-1}), the scattering angles are very weak (about 1 mrad). Consequently, the scattering signals are averaged along the whole observation chord, resulting in poor longitudinal spatial localisation. However, by virtue of the pitch angle variation of the magnetic field lines in the tokamak, and of the perpendicularity of the turbulence wave vector to these field lines, it has been possible to obtain partial spatial resolution along the direction of the beam. Good agreement between the experimental and theoretical angular resolution of the diagnostic as well as the results of cross-correlation performed on the signals obtained by two simultaneous probing beams also justify this novel concept. From the variation of the fluctuation power with the orientation angle of the observed wave sector, it has been possible to deduce the radial fluctuation profile by a deconvolution procedure, showing that the fluctuations increase sharply near the edge. The k-spectrum was also measured and shows a k^{-3} dependence for $k>6$ cm^{-1}. Experimental evidences are put forward to show that the k-spectrum is neither purely poloidal nor purely radial in the (k_r-k_θ) plane.

2329 (FRCEA-TH–365) **Anomalous energy transport in hot plasmas: solar corona and Tokamak.** Beaufume, P. CEA Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France); Ecole Centrale des Arts et Manufactures, 92 - Chatenay-Malabry (France). Apr 1992. 228p. (In French). Order Number DE93721057. Source: OSTI; NTIS (US Sales Only); INIS.

Anomalous energy transport is studied in two hot plasmas and appears to be associated with a heating of the solar corona and with a plasma deconfining process in tokamaks. The magnetic structure is shown to play a fundamental role in this phenomenon through small scale instabilities which are modelized by means of a nonlinear dynamical system: the Beasts' Model. Four behavior classes are found for this system, which are automatically classified in the parameter space thanks to a neural network. We use a compilation of experimental results relative to the solar corona to discuss current-based heating processes. We find that a simple Joule effect cannot provide the required heating rates, and therefore propose a dimensional model involving a resistive reconnective instability which leads to an efficient and discontinuous heating mechanism. Results are in good agreement with the observations. We give an analytical expression for a diffusion coefficient in tokamaks when magnetic turbulence is perturbing the topology, which we validate thanks to the standard mapping. A realistic version of the Beasts' Model allows to test a candidate to anomalous transport: the thermal filamentation instability.

2330 (GA-A–21003) **Current drive with fast waves, electron cyclotron waves, and neutral injection in the DIII-D tokamak.** Prater, R. (General Atomics, San Diego, CA (United States)); Petty, C.C.; Pinsker, R.I.; Chiu, S.C.; deGrassie, J.S.; Harvey, R.W.; Ikel, H.; Lin-Liu, Y.R.; Luce, T.C.; James, R.A.; Porkolab, M.; Baity, F.W.; Goulding, R.H.; Hoffmann, D.J.; Kawashima, H. General Atomics, San Diego, CA (United States). Sep 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ;AC02-78ET51013 ;AC02-76CH03073 ;AC05-84OR21400. (CONF-920717–5: Topical conference meeting on radio frequency heating and current drive of fusion devices, Brussels (Belgium), 7-10 Jul 1992). Order Number DE93001359. Source: OSTI; NTIS; INIS; GPO Dep.

Current drive experiments have been performed on the DIII-D tokamak using fast waves, electron cyclotron waves, and neutral injection. Fast wave experiments were performed using a 4-strap antenna with 1 MW of power at 60 MHz. These experiments showed effective heating of electrons, with a global heating efficiency equivalent to that of neutral injection even when the single pass damping was calculated to be as small as 5%. The damping was probably due to the effect of multiple passes of the wave through the plasma. Fast wave current drive experiments were performed with a toroidally directional phasing of the antenna straps. Currents driven by fast wave current drive (FWCD) in the direction of the main plasma current of up to 100 kA were found, not including a calculated 40 kA of bootstrap current. Experiments with FWCD in the counter current direction showed little current drive. In both cases, changes in the sawtooth behavior and the internal inductance qualitatively support the measurement of FWCD. Experiments on electron cyclotron current drive have shown that 100 kA of current can be driven by 1 MW of power at 60 GHz. Calculations with a Fokker-Planck code show that electron cyclotron current drive (ECCD) can be well predicted when the effects of electron trapping and of the residual electric field are included. Experiments on driving current with neutral injection showed that effective current drive could be obtained and discharges with full current drive were demonstrated. Interestingly, all of these methods of current drive had about the same efficiency, 0.015×10^{20} MA/MW/m^2.

2331 (IC–92/157) **Intuitive approach to modified gyrokinetic equation and numerical confirmation.** Chen, C.Y.; Mahajan, S.M. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 11p. Order Number DE93604671. Source: OSTI; NTIS (US Sales Only); INIS.

It has been revealed in a recent paper that although the gyrokinetic equation based on separating the total perturbed distribution function into adiabatic and nonadiabatic parts is accepted as a standard approach, the method has substantial problems, i.e., the theory is inherently gauge-dependent and suffers some conceptual difficulties. In this paper, we propose an intuitive approach to modify the standard theory. The approach may help to put the problem in clearer perspective. Each term of the standard gyrokinetic equation is analyzed in light of its physical and mathematical implication, and then corresponding modification follows from suitable arguments. In particular, it is argued that gyrating particles in a magnetized plasma cannot adibatically respond to a perpendicular wave-like field so that the "adiabatic" terms in the equation should be treated equally with other terms and should be gyro-averaged to make the gyrokinetic effect emerge. It is motivated that as many as possible heuristic arguments can be discussed in the paper. After establishing the modified gyrokinetic equation, we verify our approach numerically with the code developed on the Runge-Kutta algorithm. (author). 5 refs, 3 figs.

2332 (IC–92/159) **Are there missing convective currents?.** Chen, C.Y. International Centre for Theoretical Physics, Trieste (Italy). 1992. 7p. Order Number DE93604672. Source: OSTI; NTIS (US Sales Only); INIS.

It is revealed in this letter that as far as distribution functions obtained from gyrokinetic equations are concerned, the standard formulae to evaluate currents in plasmas are not applicable due to the fact that those distribution functions are given in a moving coordinate frame and the moving is essentially related to perturbed fields. With heuristic and analytic approaches, appropriate formulae are obtained to evaluate several types of currents in plasmas of which some have been missing in previous approaches. (author). 6 refs, 1 fig.

The fifth Plasma Physics Network Newsletter (IAEA, Vienna, August 1992) includes the following topics: (i) the availability of a list of the members of the Third World Plasma Research Network (TWPRN); (ii) the announcement of the fourteenth IAEA International Conference on Plasma Physics and Controlled Nuclear Fusion Research to be held in Wuerzburg, Germany, from September 30 to October 7, 1992; (iii) the announcement of a Technical Committee Meeting on research using small tokamaks, organized by the IAEA as a satellite meeting to the aforementioned fusion conference; (iv) IAEA Fellowships and Scientific Visits for the use of workers in developing member states, and for which plasma researchers are encouraged to apply through Dr. D. Banner, Head, Physics Section, IAEA, P.O. Box 100, A-1400 Vienna, Austria; (v) the initiation in 1993 of a new Coordinated Research Programme (CRP) on "Development of Software for Numerical Simulation and Data Processing in Fusion Energy Research", as well as a proposed CRP on "Fusion Research in Developing Countries using Middle- and Small-Scale Plasma Devices"; (vi) support from the International Centre for Theoretical Physics (ICTP) for meetings held in Third World countries; (vii) a report by W. Usada on Fusion Research in Indonesia; (viii) News on ITER; (ix) the Technical Committee Meeting planned September 8-12, 1992, Canada, on Tokamak Plasma Biasing; (x) software made available for the study of tokamak transport; (xi) the electronic mail address of the TWPRN; (xii) and the FAX, e-mail and postal address for contributions to this plasma physics network newsletter (FAX: (43-1)-234564).

2337 (IYaF–91-66) **Measurements of the energy spectrum of an intense microsecond relativistic electron beam in the beam-plasma experiments using a multi-foil analyzer.** Knyazev, B.A.; Mel'nikov, P.I.; Nikiforov, A.A.; Chikunov, V.V. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 37p. (In Russian). Order Number DE93606271. Source: OSTI; NTIS (US Sales Only); INIS.

Energy spectra of a 1 MeV, 70 kA, 4μs, 140 kJ relativistic electron beam (REB) on the U1-SPIN device are measured before and after passing through gas/plasma prefilled drift chamber using multifoil analyzer. The drift chamber is a 1-long, 10 cm diameter stainless steel tube with 4T longitudinal magnetic field. The initial beam injected to the tube from the accelerator diode is monoenergetic. For high gas densities ($\approx 10^{16} cm^{-3}$) the energy spectrum on the exit of the tube remains the same as it is the diode. If the gas/plasma density is less then $10^{15} cm^{-3}$ the energy loss up to 20% is observed. At the initiak gas density about $10^{13} cm^{-3}$ appreciable fraction ($\approx$10%) of the beam electrons with the energy more than initial one appears. Specific features of the diagnostic technique are discussed in details. 21 refs.; 15 figs.

2338 (IYaF–91-68) **Experimental MHD stability limit in the gas-dynamic trap.** Bagryanskij, P.A. (and others); Ivanov, A.A.; Karpushov, A.N. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 14p. Order Number DE93606218. Source: OSTI; NTIS (US Sales Only); INIS.

This paper summarizes the results of extensive experimental investigations of a plasma MHD stability in gas-dynamic trap GDT, which have been carried out over past 3 years at Novosibirsk. The objective of the experiments reported was to give experimental evidence of plasma stability in GDT and compare the conditions, under which it would be achieved, with the theoretical predictions. It was found that theoretical predictions generally agree with the measurements with only one notable exception, namely the limit in the mirror ratio for the plasma stability. This observation is discussed in detail. 12 refs.; 5 figs.

2339 (IYaF–91-102) **Analysis of possibilities for using laser scattering for MeV electron beam diagnostics.** Arzhannikov, A.V. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 24p. (In Russian). Order Number DE93606223. Source: OSTI; NTIS (US Sales Only); INIS.

Analysis of a possibility of measuring the longitudinal speed spread of MeV electrons by laser scattering is performed. The choice of the wave length and the power of an initial laser beam as well as its incidence angle to the beam and scattered radiation detection angle is discussed therewith. Shapes of spectra of radiation scattered on the beams with different distribution function are presented and effect of movement of electrons in intrinsic beam fields on them is discussed. 17 refs.; 9 figs.

2340 (IYaF–91-106) **Analyzer of energy spectra of a magnetized relativistic electron beam.** Voropaev, S.G.; Deulin, Yu.I.; Karyukin, A.V.; Lebedev, S.V.; Shcheglov, M.A. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 15p. (In Russian). Order Number DE93606224. Source: OSTI; NTIS (US Sales Only); INIS.

Analyzer of magnetized REB instant energy spectrum is described. The analyzer operation principle is based on the application of a sharp change of the direction of force lines of a magnetic field which is non-adiabatic for the beam electrons. The analyzer design is described, the main factors effecting the energy resolution are considered. The analyzer serviceability is examined in the course of experiments on plasma heating using a heavy-current microsecond REB at the GOL-3 device. The analyzer energy resolution which does not exceed 10% at 0.8 MeV energy and 20% at 0.3 MeV is determined. Beam energy spectra are obtained in one of the regimes of beam interaction with plasma. The efficiency of beam interaction with plasma determined using the analyzer achieves 30%. 10 refs.; 7 figs.

The critical β value as a function of the inverse number of coils is shown for cases in which the plasma-coil gap is 20, 30, 40 and 50 cm. With 32 coils, the β value is virtually unaltered when the coil plasma distance exceeds 30 cm. With 16 coils, the critical β degrades when the gap is smaller than 40 cm. (author) 2 figs., 9 refs.

The problem of wave induced stochasticity in plasmas is being studied extensively because of its general interest in chaotic dynamics and of its possible direct consequences in space and laboratory plasmas, such as anomalous transport and non-linear heating and particle acceleration. In our experiment we investigate the interaction between ions and two propagating electrostatic modes in a Q-machine plasma. In particular, our aim is to perform and integrate observations of the collective ion response (wave characteristics), of ion kinetic features (modification of the distribution functions, time scale for heating) and of single particle orbit modifications (phase space transport). (author) 4 figs., 8 refs.

Non-axisymmetric magnetic field perturbations generated, for example, by errors in the alignment of the field coils are known to lead to reduced confinement in a tokamak. By inducing the formation of small, stationary, magnetic islands on all rational surfaces they can enhance radial transport and under certain circumstances interact with MHD instabilities to trigger the onset of locked modes leading, in some cases, to disruption of the plasma discharge. Given the stationary nature of the error field islands it is natural to consider whether they can be reduced significantly by the viscous drag of a sheared flow resulting from a bulk rotation of the plasma. In this paper, we examine this interaction by modelling the nonlinear growth and saturation of force-reconnected magnetic islands driven by a corrugated boundary in a slab plasma with an initially uniform flow. A systematic parameter study is made of the time asymptotic steady state. (author) 3 figs., 5 refs.

2344 (PPPL–2858) **Neutron emission from TFTR supershots.** Strachan, J.D. (Princeton Univ., NJ (United States). Plasma Physics Lab.); Bell, M.G.; Bitter, M.; Budny, R.; Hawryluk, R.; Hill, K.W.; Hsuan, H.; Jassby, D.L.; Johnson, L.C.; LeBlanc, B.; Mansfield, D.; Meade, D.; Mikkelsen, D.R.; Mueller, D.; Park, H.; RPrinceton Univ., NJ (United States). Plasma Physics Lab. Oct 1992. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE93002632. Source: OSTI; NTIS; INIS; GPO Dep.

Empirical scaling relations are deduced describing the neutron emission from TFTR supershots using a data base that includes all of the supershot plasmas (525) from the 1990 campaign. A physics-based scaling for the neutron emission is derived from the dependence of the central plasma parameters on machine settings and the energy confinement time. This scaling has been used to project the fusion rate for equivalent DT plasmas in TFTR, and to explore machine operation space which optimizes the fusion rate. Increases in neutron emission are possible by either increasing the toroidal magnetic field or further improving the limiter conditioning.

Source: OSTI; NTIS (US Sales Only); INIS.

The European R and D programme in support of the development of water-cooled Pb-17Li blankets for DEMO aims at improving the data base concerning tritium behaviour and compatibility between blanket materials. The four main areas of the experimental programme are structural material corrosion by Pb-17Li, tritium extraction and permeation control.=, Pb-17Li physico-chemistry, and water/Pb-17Li interaction. This paper describes the most significant results obtained to date in the various experiments performed in Europe and the future programme required to complete the data base by 1994. 28 refs.

CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1992. 8p. (CONF-920607–: 10. topical meeting on technology of fusion energy, Boston, MA (United States), 7-12 Jun 1992). Order Number DE93721109. Source: OSTI; NTIS (US Sales Only); INIS.

Within the framework of the European DEMO blanket study programme, this paper describes the design work performed on the 'box-shaped' concept for water-cooled Pl-17Li blankets in the past two years. The first part of the paper describes the general design, and the thermo-mechanical and neutronical analyses of the main segment structure leading to the optimization of the thickness of

the various component. The second part describes specific analysis of particular segment regions, like water- and Pb-17Li-headers, box bottom and support, which have required detailed design development. All results indicate that the 'box-shaped' concept is a very promising candidate for DEMO reactor blankets.

2351 (CEA-CONF–11001) **Experimental programme in support of the development of the European ceramic-breeder-inside-tube test-blanket: present status and future work.** Proust, E. Four DEMO blanket classes are under investigation within the framework of the European Test-Blanket Development Programme. One of them is featured by the use of lithium ceramic breeder pellets contained inside externally helium cooled tubes. This paper summarizes the main achievements to date of the experimental programme supporting the development of this class of blanket. It also gives an outline of the areas of the breeder material, beryllium, tritium control, and thermomechanical tests, the future work envisaged for the 92-94 period. 53 refs.

2352 (CEA-CONF–11002) **Further adaptation of the European ceramic-B.I.T. blanket conceptual design to updated Demo specifications.** Proust, E. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie); Szczepanski, J.; Bielak, B. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1992. 7p. (CONF-920607–: 10. topical meeting on technology of fusion energy, Boston, MA (United States), 7-12 Jun 1992). Order Number DE93721111. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents the recent development studies on the adaptation of the European Ceramic Solid Breeder Inside Tube (BIT) Blanket to updated DEMO specifications. The adaptation work is in progress, since 1990, when a detailed comparison between two existing designs lead to the selection of an unique concept. The main new developments concern the separation in two parts of the inboard blanket segments at the level of the lower divertor, the consequent improvement of the blanket coverage, the simplification of maintenance operations, and finally the increased compactness of the blanket because of the inclusion of the shielding into the breeder assembly.

2353 (CEA-N–2692) **Effect of induced spatial incoherence on parametric instabilities.** Bourdier, A. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)); Pesme, D.; Bortuzzo-Lesne; Berger, R.L.; Williams, E.A. CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France). 1992. 107p. (In French). Order Number DE93721711. Source: OSTI; NTIS (US Sales Only); INIS.

The effect on parametric instability growth of pump wave incoherence is treated by deriving a set of equations governing the space-time evolution of the ensemble-average coupled-mode amplitudes and intensities. Particular attention is paid to establishing the regions of validity of the statistical description. Thresholds, growth rates, and amplification rates are given for both spatially and temporally incoherent pump waves. Both absolutely and convectively unstable modes are considered. The statistical results are verified where appropriate by numerical integration of the coupled-mode equations with different models of pump incoherence.

2354 (CFFTP-G–8906) **UTIAS tritium exposure facility for fusion materials studies.** Youle, I.S. (Toronto Univ., ON (Canada). Inst. for Aerospace Studies); Haasz, A.A. Canadian Fusion Fuels Technology Project, Toronto, ON (Canada). Jul 1989. 25p. Order Number DE93604728. Source: OSTI; NTIS (US Sales Only); INIS.

A low-level tritium facility, directed at fusion materials research, was built at UTIAS. The facility consists of a bakeable uhv system housed in a continuously ventilated glove box. The system is totally oil-free, and is pumped by a combination of cryosorption, cryocondensation and getter pumps. Test specimens are studied under molecular or atomic tritium exposure. Experiments to date have been focussed on studies of chemical erosion of carbon, tritium retention and diffusion in graphite.

2355 (CFFTP-G–9028) **ITER isotope separation system: Alternative distributed ISS design study - Revision 0.** Busigin, A. (Ontario Hydro, Toronto, ON (Canada)); Sood, S.K.; Kveton, O.K.; Sherman, R.H.; Anderson, J.L. Canadian Fusion Fuels Technology Project, Toronto, ON (Canada). Sep 1990. 27p. (ITER-IL-FC–9.2-0-31.). Order Number DE93604737. Source: OSTI; NTIS (US Sales Only); INIS.

This document presents the results of a study that examined the technical operating and economic viability of an alternative Isotope Separation System (ISS) design based on the distributed design concept. In the distributed design, the ISS is broken up into local independently operable subsystems matched to local processing requirements. The distributed design accepts the same feeds and produces essentially the same products as the reference design. The distributed design consists of two separate, independent subsystems. The first, called ISS-H, receives only protium-dominated streams and waste water from tritium extraction. It has two cryogenic distillation columns and can produce a 50 percent D, 50 percent T product since it lacks D/T separation capability. A final 80 percent T_2 concentration product can be obtained by blending the 50 percent T_2 stream from ISS-H with the more than 99 percent T_2 stream from the second subsystem, ISS-D. The second subsystem receives only deuterium-dominated feeds, which also contain some protium. ISS-D is as complex as the reference design, but smaller. Although each subsystem has some advantages, such as only two cryogenic distillation columns in ISS-H and better than 99 percent steady state T_2 product in ISS-D, the combined subsystems do not offer any real advantage compared to the reference IISS. The entire distributed ISS design has been simulated using Ontario Hydro's FLOSHEET steady state process simulator. Dynamic analysis has not been done for the distributed design. (10 refs., 3 figs., 8 tabs.).

2356 (CFFTP-G–9091) **ITER fuel cycle systems: Cost estimation review - revision 1.0.** Kveton, O.K. Canadian Fusion Fuels Technology Project, Toronto, ON (Canada). Nov 1990. 26p. (ITER-IL-FC–2.9-0-76.). Order Number DE93604738. Source: OSTI; NTIS (US Sales Only); INIS.

This document records the assumptions under which the ITER Fuel Systems cost estimates were prepared. These are order of magnitude estimates, obtained without flow sheet or detailed equipment analysis by applying factors, ratios, and escalation to the known cost of an installation considered to be similar. The estimates include equipment and installation costs for each component. (5 figs., 16 refs.).

2357 (CFFTP-G–9092) **ITER fuel cycle systems: Energy requirements - Revision 0.0.** Kveton, O.K. Canadian Fusion Fuels Technology Project, Toronto, ON (Canada). Nov 1990. 13p. (ITER-IL-FC–9.5.1-0-47.). Order Number DE93604739. Source: OSTI; NTIS (US Sales Only); INIS.

This document identifies the primary sources of power requirements, and records the assumptions under which the Fuel Systems power consumption was estimated and balanced. (2 tabs., 15 refs.).

2358 (CONF-920146–6) **Fracture toughness measurements with subsize disk compact specimens.** Alexander, D.J. Oak Ridge National Lab., TN (United States). [1992]. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From ASTM international symposium on small specimen test techniques and their applications to nuclear reactor vessel thermal annealing and plant life extension; New Orleans, LA (United States); 29-31 Jan 1992. Order Number DE93001374. Source: OSTI; NTIS; INIS; GPO Dep.

Special fixtures and test methods have been developed for testing small disk compact specimens (12.5 mm diam by 4.6 mm thick). Both unloading compliance and potential drop methods have been used to monitor crack extension during the J-integral resistance (J-R) curve testing. Provisions have been made to allow the necessary probes and instrumentation to be installed remotely using manipulators for testing of irradiated specimens in a hat cell. Laboratory trials showed that both unloading compliance and potential drop gave useful results. Both techniques gave similar data,

and predicted the final crack extension within allowable limits. The results from the small disk compact specimens were similar to results from conventional compact specimens 12.7-mm thick. However, the slopes of the J-R curves from the larger specimens were lower, suggesting that the smaller disk compact specimens may have lost some constraint due to their size. The testing shows that it should be possible to generate useful J-R curve fracture toughness data from the small disk compact specimens.

2359 (CONF-920930–10) **ORNL centrifuge pellet fueling system.** Foster, C.A. (Oak Ridge National Lab., TN (United States)); Houlberg, W.A.; Gouge, M.J.; Grapperhaus, M.J.; Milora, S.L.; Drawin, H.; Geraud, A.; Chatelier, M.; Gros, G. Oak Ridge National Lab., TN (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 17. symposium on fusion technology; Rome (Italy); 14-18 Sep 1992. Order Number DE93001362. Source: OSTI; NTIS; INIS; GPO Dep.

A centrifuge pellet injecter designed and built at Oak Ridge National Laboratory (ORNL) is in operation on Tore Supra. This injector has the capability of injecting up to 100 pellets at speeds up to 800 M/s. The solid deuterium pellets can be formed with a variable mass from 3 to 10 torr-L and are fired at a rate of up to 10 pellets per second. The experimental program that is under way combines repetitive pellet fueling with the ergodic divertor and pump limiters to establish and understand long-pulse plasmas in which the pellet fuel source is in balance with the particle exhaust. With lower hybrid current drive, pulse lengths of up to 2 min might be achieved. To prepare for these extended pulse lengths, the pellet source on the centrifuge will be extended to provide a 300- to 500-pellet capability. A similar system extended to steady-state pellet fabrication technology and designed for a radiation and tritium environment would be a candidate for a fueling system for the International Thermonuclear Experimental Reactor (ITER). Analysis of pellet-fueled ITER discharges using the WHIST code shows the potential for controlling the radial fuel deposition point to achieve the desired core density while maintaining the edge density and temperatures so as to minimize the diverter plate erosion. A centrifuge fueling system would have the capability of taking the D-T exhaust directly from the cryopumping systems, recondensing and purifying the fuel, and injecting the reconstituted pellets into the plasma, thereby minimizing the tritium inventory.

2360 (CONF-920930–11) **High-speed repetitive pellet injector prototype for magnetic confinement fusion devices.** Frattolillo, A. (Associazione EURATOM-ENEA per la fusion, Frascati (Italy)); Gasparotto, M.; Migliori, S.; Angelone, G.; Baldarelli, M.; Scaramuzzi, F.; Ronci, G.; Combs, S.K.; Milora, S.L.; Foust, C.R.; Gouge, M.J.; Reggiori, A.; Riva, G.; Carlevaro, R.;.Oak Ridge National Lab., TN (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 17. symposium on fusion technology; Rome (Italy); 14-18 Sep 1992. Order Number DE93001361. Source: OSTI; NTIS; INIS; GPO Dep.

The design of a test facility aimed at demonstrating the feasibility of high-speed repetitive acceleration of solid D_2 pellets for fusion applications, developed in a collaboration between Oak Ridge National Laboratory and ENEA Frascati, is presented. The results of tests performed at the CNPM/CNR on the piston wear in a repetitively operating two-stage gun are also reported.

2361 (DOE/ER/53198–205) **B_4C solid target boronization of the MST reversed-field pinch.** Den Hartog, D.J.; Cekic, M.; Fiksel, G.; Hokin, S.A.; Kendrick, R.D.; Prager, S.C.; Stoneking, M.R. Wisconsin Univ., Madison, WI (United States). Dept. of Physics. Oct 1992. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER53198. Order Number DE93002736. Source: OSTI; NTIS; INIS; GPO Dep.

A solid rod of hot-pressed boron carbide is being used as the source of boron during boronization of MST. The most striking result of this procedure is the reduction in oxygen contamination of the plasma (O III radiation, characteristic of oxygen at the edge, falls by about a factor of 3 after boronization.). The radiated power fraction drops to about half its initial value. Particle reflux from the wall is also lowered, making density control simpler. The rod (12.7 mm diameter) is inserted into the edge plasma of normal high-power RFP discharges. B_4C is ablated from the surface of the rod and deposited in a thin film (a-B/C:H) on the walls and limiters. The energy flux carried by "superthermal" (not "runaway") electrons at the edge of MST appears to enhance the efficient, non-destructive ablation of the boron carbide rod.

2362 (ECN-RX–91-074) **High emissivity TiC coatings for a first wall: Presented at the Second International Symposium on Fusion Nuclear Technology, June 2-7, 1991, Karlsruhe, Germany.** Groot, P. (Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H); Dvorak, M. Netherlands Energy Research Foundation (ECN), Petten (Netherlands). Aug 1991. 10p. (CONF-9106310–: 2. international symposium on fusion nuclear technology and exposition, Karlsruhe (Germany), 2-7 Jun 1991). Order Number DE93604740. Source: OSTI; NTIS; INIS.

Submitted for publication in: Fusion Engineering and Design.

Part of the First Wall of the conceptual design of Next European Torus NET consist of radiation cooled carbon tiles. Tile temperature is determined by the optical properties of facing surfaces. Heat transfer to the 316 stainless steel structure can be improved by applying a high emissivity coating. For this purpose ceramic coatings can be applied. This paper deals with development and characterization of atmospheric and vacuum plasma sprayed titanium carbide as high emissivity coatings. Microstructural evaluation of these coatings includes X-ray diffraction and light microscopy of cross-sections. Total emissivities of vacuum and atmospheric plasma sprayed TiC coatings were measured at 525 K at PTB Braunschweig. Reflection measurements were performed at ECN Petten by using a YAG laser with wavelength 1.06 μm at room temperature. The effects of compositional differences on optical properties are discussed. (author). 9 refs.; 5 figs.; 1 tab.

2363 (EUR–14028) **Numerical analysis and nuclear standard code application to thermal fatigue.** Merola, M. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). Commission of the European Communities, Luxembourg (Luxembourg). 1992. 43p. Source: OSTI; NTIS (US Sales Only); INIS.

The present work describes the Joint Research Centre Ispra contribution to the IAEA benchmark exercise 'Lifetime Behaviour of the First Wall of Fusion Machines'. The results of the numerical analysis of the reference thermal fatigue experiment are presented. Then a discussion on the numerical analysis of thermal stress is tackled, pointing out its particular aspects in view of their influence on the stress field evaluation. As far as the design-allowable number of cycles are concerned the American nuclear code ASME and the French code RCC-MR are applied and the reasons for the different results obtained are investigated. As regards a realistic fatigue lifetime evaluation, the main problems to be solved are brought out. This work, is intended as a preliminary basis for a discussion focusing on the main characteristics of the thermal fatigue problem from both a numerical and a lifetime assessment point of view. In fact the present margin of discretion left to the analyst may cause undue discrepancies in the results obtained. A sensitivity analysis of the main parameters involved is desirable and more precise design procedures should be stated.

2364 (EUR–14434/1) **JET Joint Undertaking. Progress report 1991 - volume 1.** Commission of the European Communities, Luxembourg (Luxembourg). Apr 1992. 207p. Source: OSTI; NTIS (US Sales Only); INIS.

The ninth JET Progress Report provides an overview summary and puts into context the scientific and technical advances made on JET during 1991. The report contains a brief summary of the background to the project, and describes the basic objectives of JET and the principal design aspects of the machine.

2365 (EUR–14434/2) **Jet Joint Undertaking. Progress report 1991 - volume 2.** Commission of the European Communities, Luxembourg (Luxembourg). Apr 1992. 314p. Source: OSTI; NTIS (US Sales Only); INIS.

This volume is an appendix of vol. 1 and contains selected articles prepared by JET authors providing some details of the activities and achievements made on JET during 1991.

2366 (EUR-CEA-FC–1447) **Quasi-optical concepts for lower hybrid waves launchers on large tokamaks.** Bibet, P.; Crenn, J.P. Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. Jan 1992. 60p. Source: OSTI; NTIS (US Sales Only); INIS.

New types of antennas, based on quasi-optical propagation, are considered for heating large Tokamaks (JET, ITER) at the lower hybrid frequency. The use of quasi-optical techniques in these antennas allows to compete with waveguides used up to now. Two types of LHW launchers are studied in which the radiating antenna is associated to a grill composed of either a waveguide array or a diffraction rod array. The first type leads to low power transmission values. In the second type, Gaussian beams are launched by radiating antenna in order to have a smaller angle of divergence improving the emission. More thorough theoretical and experimental studies are needed, to make this concept more precise and to compare it to LHW launchers based strictly on waveguide concept.

2367 (EUR-CEA-FC–1451) **Optical visualization of electric and magnetic field perturbations in tokamak discharges by hydrogen pellet injection.** Drawin, H.W.; Dubois, M.A. Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. Apr 1992. 21p. Source: OSTI; NTIS (US Sales Only); INIS.

Two-dimensional intensity distribution mappings of photographs of pellet ablation cloud trajectories in the TFR and TS tokamaks reveal irregular shapes of the luminous striations. The observed features are not well understood, but can be described and interpreted as the first direct visual observation of pre-existing electric and/or magnetic field perturbations in the hot core of tokamak plasmas. It is suggested to use pellet injection as a diagnostic tool for the study of plasma structures and transport phenomena.

2368 (EUR-CEA-FC–1452) **The effect of the ergodic divertor on electron thermal confinement.** Harris, G.R.; Capes, H.; Garbet, X. Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. Jun 1992. 23p. Source: OSTI; NTIS (US Sales Only); INIS.

The thermal confinement within the confinement zone of Tore Supra ohmically heated deuterium plasmas bounded by the ergodic divertor (ED) configuration is studied in a 1 1/2D analysis of the local power balance. Although the edge electron temperature and mean electron density (n_e) are both on average halved with application of the ED, the mean electron thermal diffusivity χ_e shows the same density dependence as exhibited by standard ohmic limiter discharges, i.e., an Alcator-like inverse dependence on (n_e) at low density and a saturation at high density. The ion thermal transport at low to medium densities in both limiter and ED discharges is between 10 to 20 times that predicted by neoclassical theory. Comparing ED and limiter plasmas of the same density, a strong plasma decontamination is observed, with a reduction, in Z_{eff} by between 1.0 to 1.5. The effective decoupling of (n_e) and Z_{eff} by the ED and the invariant behaviour of χ_e imply that electron thermal transport is only weakly dependent on Z_{eff} in ohmic Tore Supra discharges.

2369 (EUR-CEA-FC–1455) **Particle flux across a stochastic magnetic layer.** Samain, A.; Capes, H.; Ghendrih, P.; Nguyen, F. Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. May 1992. 17p. Source: OSTI; NTIS (US Sales Only); INIS.

The radial particle transport is considered in a plasma with ergodic and stochastic flux lines. The self consistent electric field is neglected and the particle flux is due to a succession of mass convections along flux lines in series with transverse diffusions at very small scale between neighbouring flux lines. We investigate the dependence of the average radial flux in terms of the thermodynamic forces, namely the pressure gradient which controls the parallel convection and the density gradient which controls the small scale transverse diffusion. The condition for which the average radial flux is driven by the average pressure or density gradient is derived.

The ergodic divertor experiments in TORE SUPRA can be analysed along two main lines. The first one refers to the change of the heat and particle transport in the ergodized zone. This is especially true for the electron heat transport which is enhanced in the edge layer. But other distinctive features give evidence of the importance of the parallel connexion length between the plasma edge and the wall. The field lines, which are stochastic in the major part of the perturbed layer (10-15 cm) are such that, in the outermost layer (3 cm), the connexion topology is regular. This has obvious effects on the particle and power deposition, but also on the plasma parameters, and consequently influences the particle recycling and impurity shielding processes. The TORE SUPRA ergodic divertor experiments are reviewed in this framework.

2372 (EUR-CEA-FC–1456, pp. 35-50) **Thermodesorption studies of boron doped graphite exposed to a low energy high density deuterium plasma.** Gauthier, E. (Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee); Grisolia, C.; Fernandez, V.; Bardon, J. Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. 1992. The thermodesorption of deuterium and some deuterocarbons from bulk boron doped carbon samples with different B/C ratios has been studied after exposure to a deuterium plasma. The ion bombarding energies were set between 50 eV and 260 eV. Increasing the boron content of the sample lowers the temperature of the maximum desorption rate and increases the amount of desorbed deuterium. These results are shown to be in agreement with recent studies by other authors in spite of the very different experimental conditions.

2373 (EUR-CEA-FC–1456, pp. 51-63) **Plasma wall particle balance in Tore Supra.** Grisolia, C. (Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee); Ghendrih, P.; Pegourie, B.; Grosman, A. Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. 1992. (CONF-920311–: 10. international conference on plasma-surface interactions in controlled fusion devices, Monterey, CA (United States), 30 Mar - 3 apr 1992). In *Plasma surface interactions in controlled fusion devices.* 141p. Order Number DE93721122. Source: OSTI; NTIS (US Sales Only); INIS.

A comprehensive study of the particle balance between the carbon wall and the plasma is presented. One finds that the effective

particle content of the wall which governs the plasma equilibrium density departs from the deposited number of particles. This effect is dominant for the fully desaturated wall. A scaling law of the plasma density in terms of the wall effective particle content has been obtained. Moreover, the experimental data allows to estimate the plasma particle confinement time. Values ranging from 0.2 s to 0.5 s are found depending on the density. An analytical functional dependence of the particle confinement time is obtained.

2374 (EUR-CEA-FC–1456, pp. 64-80) **Boronization in Tore-Supra.** Gauthier, E. (Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee); Grisolia, C.; Grosman, A.; Hess, W.; Hutter, T.; De Michelis, C.; Monier-Garbet, P.; Poutchy, L.; Roth,Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. 1992. (CONF-920311–: 10. international conference on plasma-surface interactions in controlled fusion devices, Monterey, CA (United States), 30 Mar - 3 apr 1992). In *Plasma surface interactions in controlled fusion devices.* 141p. Order Number DE93721122. Source: OSTI; NTIS (US Sales Only); INIS.

First boronization was achieved in Tore-Supra with a 10% B_2H_6+He mixture. A quantitative inventory of the boron compound deposition during the boronization by means of residual gas analysis shows that at wall temperature of 200 deg C, 96.4% of the diborane is cracked and this ratio reaches 99.8% when the glow discharge is performed. Analysis of exposed samples yields a high boron concentration and a B/C ratio constant on the 100 nm depth of the deposited layer. The oxygen content of the discharge decreased by a factor of 5, and consequently the M.q product (M being the Murakami parameter) increased from 7 to $11.8.10^{19}m^{-2}T^{-1}$. After the second boronization performed in 10% B_2H_6+D_2 gas mixture a low isotopic ratio H/(H+D) in the plasma and enhanced recycling properties have been obtained.

2375 (EUR-CEA-FC–1456, pp. 81-95) **Effect of impurities on particle collection studies with a modular pump limiter on Tore Supra.** Loarer, T. (Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee); Chatelier, M.; Uckan, T.; Horton, L.D.; Mioduszewski, P.K. (CONF-920311–: 10. international conference on plasma-surface interactions in controlled fusion devices, Monterey, CA (United States), 30 Mar - 3 apr 1992). In *Plasma surface interactions in controlled fusion devices.* 141p. Order Number DE93721122. Source: OSTI; NTIS (US Sales Only); INIS.

Particle collection experiments with a modular pump limiter in TORE SUPRA, for ohmic and additional power heating, are reported. The essential feature of these experiments is that the pressure built up in the pump limiter plenum is only driven by the hydrogen influx whereas the total ion influx in the throat is shown to be partly due to impurities. This is consistent with experimental results which show similar evolution of Z_{eff} in the plasma and of the ratio Γ_T/p of the total ion influx Γ_T in the throat to the pressure p in the plenum. Particle collection efficiency, in terms of hydrogen influx Γ_D to the pressure ratio Γ_D/p, is shown to be roughly constant over the density (ohmic) and additional power ranges studied.

2376 (EUR-CEA-FC–1456, pp. 96-108) **Impurity screening in Tore Supra.** De Michelis, C. (Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee); Ghendrih, P.; Grisolia, C.; Grosman, A.; Hess, W.; Mattioli, M.; Monier-Garbet, P. Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. 1992. (CONF-920311–: 10. international conference on plasma-surface interactions in controlled fusion devices, Monterey, CA (United States), 30 Mar - 3 apr 1992). Ergodic divertor (ED) experiments in helium plasmas with carbonized and boronized wall conditions have been performed in Tore Supra. The intrinsic impurity decontamination effect (as well as the screening of purposely injected nitrogen impurities), previously observed in deuterium plasmas, has been confirmed also for conditions where the electron density in the confined (unperturbed) bulk plasma remains practically constant. Inward displacements of the plasma 0.10 - 0.15 m away from the ED modules result in the magnetic perturbation having little or no effect on impurities.

2377 (EUR-CEA-FC–1456, pp. 109-124) **Actively cooled pump limiters and power scrape-off length measurements in Tore-Supra.** Guilhem, D. (Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). TORE-SUPRA is a superconducting Tokamak aimed at studying long plasma pulses (>30 s). It is equipped with two types of pump limiters (PL). A provisional type, semi-inertially cooled between shots, has been used for plasma scrape off characterization. The e-folding length λq for power deposition on these components has been unfolded ($1.0cm < \lambda q < 2.4cm$) for different plasma parameters. On one hand it has been found almost independent of electron density ($10^{19}m^{-3} < ne < 5\ 10^{19}m^{-3}$), of power level up to 4 MW and of toroidal magnetic field ($1.5\ T < Bt < 4\ T$). On the other hand the strongest dependence is with plasma current ($Ip^{-1/2}$). The second type used for long pulse operation, is actively cooled during shots, its thermal time constant being less than 2 seconds. Experiments using this ITER relevant technology are presented. Three of the actively cooled limiters have been successfully tested in a steady state regime with a surface temperature less than 1000 deg C (I_p=1.6 MA). The design value for power removal on this type of limiters has been obtained. Peak power fluxes of 10 MW/m^2 have been estimated. This represents a breakthrough for high heat flux components since critical heat flux and burnout with subcooled flow boiling are major aspects for this kind of design.

2378 (EUR-CEA-FC–1456, pp. 125-141) **Effects of ionizing scrape-off layers on local recycling in Tore Supra pump limiter experiments.** Chatelier, M. (Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee); Loarer, T.; Owen, L.W.; Hogan, J.T.; Klepper, C.C.; Mioduszewski, P.K.; Uckan, T. Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. 1992. Contract DE-AC05-84OR21400. (CONF-920311–: 10. international conference on plasma-surface interactions in controlled fusion devices, Monterey, CA (United States), 30 Mar - 3 apr 1992). In *Plasma surface interactions in controlled fusion devices.* 141p. Order Number DE93721122. Source: OSTI; NTIS (US Sales Only); INIS.

A series of ohmic discharges with active pumping in the Tore Supra outboard pump limiter has been analyzed with the DEGAS neutrals transport code and an analytic scrape-off layer (SOL) plasma model. Pumping speed and plenum pressure measurements indicated 5-10 torr.L/s throughput with only modest effects on density. A model is developed in which large exhaust fluxes, with little attendant effect on core plasma density, are explained in terms of SOL ionization of recycled and wall-desorbed neutrals. Particle balance with active pumping and constant line density requires that the wall return flux exceed the incident flux by approximately the pump throughput in the absence of external fueling. The radial profile of the H^+ source rate from ionization and dissociation of wall-desorbed molecules is seen to peak very near the radial position of the limiter throat. Consequently, a strong recycling vortex is created in the region of the limiter, with the ion flux amplified by factors of 2 at the outer limiter surfaces and > 3 within the limiter throat. The calculations indicate that less than 30% of the pump throughput is due to first-generation ions from the core efflux, with the balance from local recycling in the strongly ionizing SOL.

2379 (FRCEA-TH–372) **Radiation control and study of a Tokamak plasma. Use of an ergodic divertor.** Poutchy, L. Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee; Aix-Marseille-1 Univ., 13 - Marseille (France). 15 Sep 1992. 169p. (In French). Order Number DE93721708. Source: OSTI; NTIS (US Sales Only); INIS.

The major problem of controlled thermonuclear fusion is the interaction between the plasma and the wall. It should be interesting to dissipate the power contained in the plasma through a peripheral radiating layer. This solution should allow the homogenization of the power deposition on the wall. The plasma confinement requires the localization of the radiation at the plasma edge. That is the reason why the impurities contained in the plasma have to be light impurities like carbon or oxygen, which radiate for low temperature (10 eV to 100 eV). The different mechanisms of radiation are recalled and the bolometers used on Tore Supra for radiation measurements are recalled. When the plasma density reaches a critical value dependent on the impurity content of the plasma, the radiating rate increases and edge radiating phenomena as 'marfes' and 'detached plasma' are observed. This phenomena are unstable and lead to a radiating cooling of the plasma. This cooling causes the growth of tearing instabilities and the disruption. The objectives of this work were to settle a method for avoiding disruptions and for maintaining a radiating layer at the plasma edge. Thus, radiating losses and MHD instabilities are studied. The Ergodic Divertor acts on the magnetic structure of the plasma edge and stabilizes the MHD activity. This property has been used to define a discharge piloting strategy to prevent density-limit disruptions. This strategy allows also (if the plasma edge contamination is sufficient) the stabilization of an edge radiating layer which dissipates 100% of the input power.

2380 (GA-A–21034) **Enhancement of DIII-D neutral beam system for higher performance.** Hong, R.; Colleraine, A.P.; Kellman, D.H.; Kim, J.; Luxon, J.L.; Nerem, A.; Phillips, J.; Wight, J. General Atomics, San Diego, CA (United States). Sep 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-920930–6: 17. symposium on fusion technology, Rome (Italy), 14-18 Sep 1992). Order Number DE93000878. Source: OSTI; NTIS; INIS; GPO Dep.

The DIII-D tokamak employs eight neutral beam systems for plasma heating and current drive experiments. These positive ion source neutral beam systems have gone through several improvements in operational technique and in system hardware since the start of conditioning of the first long pulse ion source in December 1986. These improvements have led to the routine operation in deuterium at beam power levels of 20 MW. The improvements in operational technique include filament power supply operating mode, accelerator grid voltage holding capability, mid changes in grid potential gradients. The hardware improvements include installation of arc notching, arc discharge density regulation, and control of neutralizer gas puffing. Each of these improvements are discussed in this paper. Successful testing and operation of the ion source at 93 kV deuterium beam energy, well above the design value of 80 kV, also led to the possibility of enhancing system capability to 28 MW power level, nearly twice the original design value. Upgrading of the beam system to 60 second pulse duration at the currently achieved power level is under consideration. Studies have shown that this pulse length extension can be achieved with improvements in beamline heat handling components and auxiliary systems, especially the power supply system. The drift duct (the section between neutral beam beamline and tokamak) upgrade and protection for the long pulse duration present the greatest challenges, and are crucial to achieving long pulse beam injection into the tokamak plasma.

2381 (GA-A–21035) **Analytical prediction of thermal performance of hypervapotron and its application to ITER.** Baxi, C.B. (General Atomics, San Diego, CA (United States)); Falter, H. General Atomics, San Diego, CA (United States). Sep 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-920930–8: 17. symposium on fusion technology, Rome (Italy), 14-18 Sep 1992). Order Number DE93001356. Source: OSTI; NTIS; INIS; GPO Dep.

A hypervapotron (HV) is a water cooled device made of high thermal conductivity material such as copper. A surface heat flux of up to 30 MW/m^2 has been achieved in copper hypervapotrans cooled by water at a velocity of 10 m/s and at a pressure of six bar. Hypervapotrons have been used in the past as beam dumps at the Joint European Torus (JET). It is planned to use them for diverter cooling during Mark II upgrade of the JET. Although a large amount of experimental data has been collected on these devices, an analytical performance prediction has not been done before due to the complexity of the heat transfer mechanisms. A method to analytically predict the thermal performance of the hypervapotron is described. The method uses a combination of a number of thermal hydraulic correlations and a finite element analysis. The analytical prediction shows an excellent agreement with experimental results over a wide range of velocities, pressures, subcooling, and geometries. The method was used to predict the performance of hypervapotron made of beryllium. Merits for the use of hypervapotrons for International Thermonuclear Experimental Reactor (ITER) and Tokamak Physics Experiment (TPX) are discussed.

2382 (IYaF–90-141) **Magnetic system of the GOL-3 plasma device.** Deulin, Yu.I.; Lebedev, S.V.; Nikolaev, V.S.; Semenov, E.P. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 9p. (In Russian). Order Number DE93606291. Source: OSTI; NTIS (US Sales Only); INIS.

Magnetic system of the GOL-3 device where the experiments on plasma heating by an intense relativistic electron beam beam are conducted, is described. The magnetic field in the solenoid makes up 6T, in magnetic mirrors on the solenoid end points -12T.

2383 (IYaF–91-105) **Vacuum-plasma system of the GOL-3 device.** Burdakov, A.V.; Dranichnikov, A.N.; Kojdan, V.S.; Nikolaev, V.S.; Postupaev, V.V.; Tauber, M.V. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 20p. (In Russian). Order Number DE93606292. Source: OSTI; NTIS (US Sales Only); INIS.

Vacuum system of the GOL-3 device, comprising a vacuum chamber, intrachamber diagnostics and vacuum pumping system, is developed, manufactured and put into operation. The system is flexible, capatable of simple reservation of the most important systems and is easy to operate. The design parameters are achieved including the limiting and operating vacuum, operating hydrogen pressure, the device readiness time. The system of producing the preliminary plasma design a heavy-current direct discharge in a metal chamber in an intense magnetic chamber in an intense magnetic field is developed. The technical solutions installed allow one to use this system in experiments on plasma heating by heavy-current relativistic electron beam. 8 refs.; 6 figs.

2384 (LA-UR–92-2904) **A need for non-tokamak approaches to magnetic fusion energy.** Bathke, C.G.; Krakowski, R.A.; Miller, R.L. Los Alamos National Lab., NM (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93000794. Source: OSTI; NTIS; INIS; GPO Dep.

Focusing exclusively on conventional tokamak physics in the quest for commercial fusion power is premature, and the options for both advanced-tokamak and non-tokamak concepts need continued investigation. The basis for this claim is developed, and promising advanced-tokamak and non-tokamak options are suggested.

2385 (LA-UR–92-2993) **A systems analysis of the ARIES tokamak reactors.** Bathke, C.G. Los Alamos National Lab., NM (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920930–3: 17. symposium on fusion technology, Rome (Italy), 14-18 Sep 1992). Order Number DE93000686. Source: OSTI; NTIS; INIS; GPO Dep.

The multi-institutional ARIES study has completed a series of cost-of-electricity optimized conceptual designs of commercial tokamak fusion reactors that vary the assumed advances in technology and physics. A comparison of these designs indicates the cost benefit of various design options. A parametric systems analysis suggests a possible means to obtain a marginally competitive fusion reactor.

2386 (LA-UR–92-3161) **Preparation of microcellular foam in cylindrical metal targets.** Apen, P.G.; Armstrong, S.V.; Moore, J.E.; Espinoza, B.F.; Gurule, V.; Gobby, P.L.; Williams, J.M. Los Alamos National Lab., NM (United States). 1 Oct 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-921129–1: 39. national symposium of the American Vacuum Society, Chicago, IL (United States), 9-13 Nov 1992). Order Number DE93000699. Source: OSTI; NTIS; INIS; GPO Dep.

The preparation of microcellular foam in cylindrical gold targets is described. The goal cylinders were fabricated by electroplating gold onto a silicon bronze mandrel and leaching the mandrel with concentrated nitric acid. After several rinsing and cleaning steps, the cylinders were filled with a solution containing trimethylolpropanetriacrylate (TMPTA). Low density, microcellular polymeric foam was prepared by in situ photopolymerization of the TMPTA solution. Foam preparation was extremely sensitive to metal ion contaminants. In particular, copper ions left behind from the leaching process inhibit polymerization and must be removed in order to obtain uniform, non-shrinking foams. A study on the effects of potential contaminants and polymerization inhibitors on TMPTA photopolymerization is presented. In addition, a procedure for the effective leaching and cleaning of gold cylinders is described.

2387 (LA-UR–92-3164) **Mercury: A second-generation KrF laser for inertial fusion research.** Bigio, I.J.; York, G.; McLeod, J.; Czuchlewski, J.; Rose, E.; Hanson, D.E.; Kurnit, N.A.; McCown, A. Los Alamos National Lab., NM (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920959–1: 9. international symposium on gas flow and chemical lasers, Heraklion (Greece), 21-25 Sep 1992). Order Number DE93000698. Source: OSTI; NTIS; INIS; GPO Dep.

The "Mercury" KrF laser facility at Los Alamos is being built with the benefit of lessons learned from the Aurora KrF laser. An increased understanding of KrF laser engineering, and the designed implementation of system flexibility, will permit Mercury to serve as a testbed for a variety of advanced KrF technology concepts.

2388 (LBL–30340) **The development of compact magnetic quadrupoles for ILSE.** Faltens, A.; Mukherjee, S.; Brady, V. Lawrence Berkeley Lab., CA (United States). Aug 1990. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-901219–17: International symposium on heavy ion inertial fusion, Monterey, CA (United States), 3-6 Dec 1990). Order Number DE92041189. Source: OSTI; NTIS; INIS; GPO Dep.

Magnetic focussing is selected for the 4 MeV to 10 MeV section of the Induction Linac Systems Experiments (ILSE) to study the transport of magnetically focussed spacecharge-dominated beams and to explore the engineering problems in accurate positioning of the magnetic fields in an array of quadrupoles. A prototype development program for such magnets is currently under way. A compact design was selected to decrease the overall accelerator diameter and its cost. The design evolved from a cosine 2θ current distribution, corrected for end effects. Current-dominated magnets are used in a pulsed mode to allow higher current densities compared to standard dc water-cooled conductors. The POISSON and MAFCO codes were used in the design of the magnets. The construction of the quadrupoles is aimed at achieving location accuracy of the magnetic center to within 1 mil (2.54×10^{-5} m) of the mechanical center.

2389 (LBL–32038) **Ion sources for cyclotron applications.** Leung, K.N.; Bachman, D.A.; McDonald, D.S.; Young, A.T. Lawrence Berkeley Lab., CA (United States). Jul 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-920741–4: 13 international conference on cyclotrons and their applications, Vancouver (Canada), 6-16 Jul 1992). Order Number DE93000568. Source: OSTI; NTIS; INIS; GPO Dep.

The use of a multicusp plasma generator as an ion source has many advantages. The development of both positive and negative ion beams based on the multicusp source geometry is presented. It is shown that these sources can be operated at steady state or cw mode. As a result they are very suitable for cyclotron operations.

2390 (NRL/MR–4790-92-7112) **Current neutralization in ballistic transport of light ion beams.** Hubbard, R.F.; Slinker, S.P.; Lampe, M.; Joyce, G.; Ottinger, P. Naval Research Lab., Washington, DC (United States). 6 Oct 1992. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93000881. Source: OSTI; NTIS; INIS; GPO Dep.

Intense light ion beams are being considered as drivers to ignite fusion targets in the Laboratory Microfusion Facility (LMF). Ballistic transport of these beams from the diode to the target is possible only if the beam current is almost completely neutralized by plasma currents. This paper summarizes related work on relativistic electron beam and heavy ion beam propagation and describes a simple simulation model (DYNAPROP) which has been modified to treat light ion beam propagation. DYNAPROP uses an envelope equation to treat beam dynamics and uses rate equations to describe plasma and conductivity generation. The model has been applied both to the high current, 30 MeV Li^{+3} beams for LMF as well as low current, 1.2 MeV proton beams which are currently being studied on GAMBLE B at the Naval Research Laboratory. The predicted ratio of net currents to beam current is ~0.1–0.2 for the GAMBLE experiment and ~0.01 for LMF. The implications of these results for LMF and the GAMBLE experiments art discussed in some detail. The simple resistive model in DYNAPROP has well-known limitations in the 1 torr regime which arise primarily from the neglect of plasma electron transport. Alternative methods for treating the plasma response are discussed.

2391 (UCLA-PPG–1323-Vol.2) **The ARIES-I tokamak reactor study: Volume 2, final report.** California Univ., Los Angeles, CA (United States). Inst. of Plasma and Fusion Research. 1991. 639p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-86ER52126 ;W-31109-ENG-38 ;AC03-89ER52153 ;AC07-76ID01570 ;W-7405-ENG-36 ;FG02-91ER54110 ;AC02-76CH03073 ;FG0 Order Number DE93002185. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains an overview of the Aries-I tokamak reactor study. The following topics are discussed on this tokamak: Systems studies; equilibrium, stability, and transport; summary and conclusions; current drive; impurity control system; tritium systems; magnet engineering; fusion-power-core engineering; power conversion; Aries-I safety design and analysis; design layout and maintenance; and start-up and operations.

2392 (UCRL-JC–110021) **Calculations of dynamic stresses in the envelopes of pulsed Xe flashlamps.** Holdener, F.R.; Platt, E.A.; Erlandson, A.C.; Frank, D.N.; Gelinas, R.J.; Jancaitis, K.S.; Larson, D.W.; Sinz, K.H. Lawrence Livermore National Lab., CA (United States). 31 Aug 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920768–6: Conference on physics and engineering of advanced detectors and collection/focusing systems, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93000632. Source: OSTI; NTIS; GPO Dep.

We have modeled dynamic stresses in the envelopes of pulsed xenon flashlamps, treating stresses produced by three different sources: the heating of the envelope by the plasma; the pressure rise of the xenon gas; and magnetic forces, due to currents flowing in nearby lamps. The heat-induced stresses were calculated by the finite element method, using uniform heating rates for the inside surface of the envelope that were inferred from flashlamp radiant efficiency measurements. Pressure-induced stresses were calculated analytically, using empirical relationships for temperature and pressure in terms of current density. Magnetically-induced stresses were also calculated analytically, for flashlamps packed parallel to each other in linear arrays.

2393 (UW-CPTC–92-4) **Calculation of neutral beam deposition accounting for excited states.** Gianakon, T.A. Wisconsin Univ., Madison, WI (United States). Dept. of Nuclear Engineering and Engineering Physics. Sep 1992. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER53218. Order Number DE93002353. Source: OSTI; NTIS; INIS; GPO Dep.

Large-scale neutral-beam auxillary heating of plasmas has led to new plasma operational regimes which are often dominated by fast ions injected via the absorption of an energetic beam of hydrogen

neutrals. An accurate simulation of the slowing down and transport of these fast ions requires an intimate knowledge of the hydrogenic neutral deposition on each flux surface of the plasma. As a refinement to the present generation of transport codes, which base their beam deposition on ground-state reaction rates, a new set of routines, based on the excited states of hydrogen, is presented as mechanism for computing the attenuation and deposition of a beam of energetic neutrals. Additionally, the numerical formulations for the underlying atomic physics for hydrogen impacting on the constiuent plasma species is developed and compiled as a numerical database. Sample results based on this excited state model are compared with the ground-state model for simple plasma configurations.

99 GENERAL AND MISCELLANEOUS

This is the monthly report for the Hanford Laboratories Operation. Metallurgy, reactor fuels, physics and instrumentation, reactor technology, chemistry, separation processes, biology, financial activities, employee relations, laboratories auxiliaries, radiation protection, operation research, inventions, visits, and personnel status are discussed. This report is for May 1960.

2398 (KFK–5031) **Progress report on research and development work 1991 of the Department of Hot Chemistry, Karlsruhe Nuclear Research Center.** Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Heisse Chemie. Mar 1991. 27p. (In German). Order Number DE93720183. Source: OSTI; NTIS (US Sales Only); INIS.

In the year under review, the Institute of Hot Chemistry (IHCH) was in the midst of a thematic reorientation process. The priority of future chemical-technical work will be in the field of the development of supercriticality processes. The objective of such work consists in seeking new ways for getting rid of resistant chemical pollutants (halogenated organic compounds). The following projects are presented in detail: (1) Waste control in the environment (communal waste management; water and soil; emission-reducing processes; highly polluted soils); (2) Solid state and materials research (chemistry of materials research); basic physical research (neutrino and particle physics); (3) Nuclear waste management (concluding work on reprocessing technology), and (4) Other research projects (Institute-related research). The Annex lists the publications made by the IHCH staff. (BBR).

2399 (KFK–5047) **Progress report on research and development work 1991 of the Department for Applied Systems Analysis, Karlsruhe Nuclear Research Center.** Kernforschungszentrum Karlsruhe GmbH (Germany). Abt. fuer Angewandte Systemanalyse. Mar 1991. 17p. (In German). Order Number DE93720174. Source: OSTI; NTIS (US Sales Only); INIS.

The following technology-oriented studies were conducted in the time period of the report: Technology assesment regarding 'Renewable Resources'; Environmental and health impact of the manufacturing and application and waste management of components and integrated circuits of micro- and optoelectronics; studies on product-oriented reduction of pollution, an innovative electronic form of presenting results of scientific projects: developing an electronic book prototype; expert systems and application of knowledge. (orig.).

2400 (AECL–9108) **Progress report - chemistry and materials division 1985 July 01 - December 31.** Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Feb 1986. 109p. (PR-CMa–69.). Order Number DE93604073. Source: OSTI; NTIS (US Sales Only); INIS.

Progress is reported in Chalk River's research programs in solid state science, general chemistry, physical chemistry, and materials science.

2401 (AECL–10180/A) **Atomic Energy of Canada Limited annual report 1989-1990.** Atomic Energy of Canada Ltd., Ottawa, ON (Canada). 1990. 62p. (In English, French). Order Number DE93604072. Source: OSTI; NTIS (US Sales Only); INIS.

In 1990, after a comprehensive industry review, the Canadian government announced that steps would be taken to revitalize the nuclear industry. Canada's nuclear utilities made a commitment to bear a large share of the cost of nuclear research and development. Atomic Energy of Canada Limited (AECL) reported its first financial loss in twelve years, as anticipated at the start of the year. Four of the 20 CANDU reactors operating worldwide were in the top ten based on lifetime performance. By year-end one foreign and two domestic utilities had announced their intention to build more CANDU units. The federal government has agreed to stabilize AECL's research funding at 1989-90 levels ($31.5 million above levels planned in 1985), has authorized AECL to negotiate with New Brunswick to build Point Lepreau-2 as the prototype for the CANDU-3 reactor, and has allowed the restructuring of AECL so utility and private sector investors can become equity partners in AECL CANDU.

Commission of the European Communities, Luxembourg (Luxembourg). 1992. 1046p. Source: OSTI; NTIS (US Sales Only); INIS.

Separate abstracts were prepared for 3 of the papers in this volume. The remaining 22 papers were considered out of the INIS scope.

2404 (IAEA-INFCIRC–1(Rev.10)) **Information circulars.** International Atomic Energy Agency, Vienna (Austria). Aug 1992. 124p. Order Number DE93604074. Source: OSTI; NTIS (US Sales Only); INIS.

The document summarizes the Information Circulars published by the IAEA for the purpose of bringing matters of general interest to the attention of all Members of the Agency. This revision contains INFCIRCs published up to mid-August 1992. A complete numerical lift of Information Circulars with their titles is reproduced in an Annex.

2405 (INIS-BR–2942) **Triennial technical report - 1986, 1987, 1988 - Instituto de Engenharia Nuclear (IEN) -Dept. of Reactors (DERE).** Instituto de Engenharia Nuclear (IEN), Rio de Janeiro, RJ (Brazil). Dept. de Reatores. 1989 147p. (In Portuguese). Order Number DE93605069. Source: OSTI; NTIS (US Sales Only); INIS.

The research activities developed during the period 1986, 1987 and 1988 by the Reactor Department of Brazilian Nuclear Energy Commission (CNEN-DERE) are summarized. The principal aim of the Department of Reactors is concerned to the study and development of fast reactors and research thermal reactors. The DERE also assists the CNEN in the areas related to analysis of power reactor structure; to teach Reactor Physics and Engineering at the University, and professional training to the Nuclear Engineering Institute. To develop its research activity the DERE has three big facilities: Argonauta reactor, CTS-1 sodium circuit, and water circuit. (M.I.).

2406 (INIS-mf–13368) **Regulatory inspection of the implementation of quality assurance programmes.** Bezpecnost Jadernych Zarizeni. Ceskoslovenska Komise pro Atomovou Energii, Prague (Czechoslovakia). 1992 108p. Translation of IAEA publication (Technical Report Series No. 296). International Atomic Energy Agency, Vienna 1989. (In Czech). Order Number DE93606018. Source: OSTI; NTIS (US Sales Only); INIS.

This manual provides guidance to Member States in the organization and performance of their regulatory inspection functions regarding the implementation of nuclear power plant quality assurance programmes. It addresses the interface between, and is consistent with, the IAEA Nuclear Safety Standards (NUSS programme) documents on quality assurance and governmental organization. The manual offers a practical model and examples for performing regulatory inspections to ensure that the quality assurance programme is operating satisfactorily in the siting, design, manufacturing, construction, commissioning, operation and decommissioning of nuclear power plants. The primary objective is to confirm that the licensee has the capability to manage and control the effective performance of all quality assurance responsibilities during all phases of a nuclear power project. The guidance provided through this manual for proper establishment and execution of the regulatory inspections helps to enforce the effective implementation of the quality assurance programme as a management control system that the nuclear industry should establish and use in attaining the safety and reliability objectives for nuclear installations. This enforcement action by national regulatory bodies and the emphasis on the purposes and advantages of quality assurance as an important management tool integrated within the total project task have been recommended by the IAEA International Nuclear Safety Advisory Group (INSAG). The primary intended users of this manual are the management personnel and high level staff from regulatory bodies but it will also be helpful to management personnel from nuclear utilities and vendors. They all are inevitable partners in a nuclear power project and this document offers all of them valuable information on the better accomplishment of quality assurance activities to ensure the common objective of safe and reliable nuclear power production.

2407 (KAERI/RR–1075/91) **Studies on establishment of nuclear safety policy.** Koh, Byung Ryung (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Ko, Seong Eun; Park, Yun Pyo; Hong, Eon Yung; Lee, Byoung Oon; Ha, Kwi Seok. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1992. 121p. (In Korean). Order Number DE93606019. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of the studies, as a first step in preparing these provisions, is to establish the long-term plan for nuclear safety research and to define the division of responsibilities for related organizations. The results of the work to the end of 1991 are as follows : 1. A Long-Term Plan for Nuclear Safety Research : The research direction and status of nuclear safety of nuclear advanced countries, such as the U.S.A. and Japan, have been analyzed and compared to those of Korea. Based on these results, a long-term nuclear safety research plan, including its implementation, has been suggested for the seven areas : (1.Severe Accident, 2.PSA(Probabilistic Safety Assessment), 3.Thermo-Hydraulic Transients, 4.Inspection and Maintenance for Operating Plant, 5.Seismology, 6.Human Factors, 7.Environments) 2. DOR between Nuclear Safety Research Organizations Nuclear advanced countries, such as the U.S.A., Japan, France and Canada, have their own research programs that are appropriate to their domestic need and environment. In these studies, the research programs and the DOR status for safety research in the above four countries was analyzed and compared to those of Korea. The results were used to define the DOR for related organizations in Korea and to propose the implementation methods for nuclear safety research. (Author).

2411 (AECL–10415) **Mathematical preliminaries to the advanced treatment of Hamiltonian dynamics.** Douglas, S.R. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Jul 1991. 33p. Order Number DE93604062. Source: OSTI; NTIS (US Sales Only); INIS.

Hamilton's equations of motion and their solution are discussed from the viewpoints of geometry and algebra. The intention is to explain the mathematical underpinnings of the Lie algebraic methods due to A. Dragt and co-workers for solving problems in charged particle optics. Most of the important formulas in Lie algebraic optics are derived. These methods are being applied to the study of the particle trajectories in the superconducting cyclotron at Chalk River Laboratories.

2412 (AECL–10423) **The multigrid method for reactor calculations.** Douglas, S.R. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Jul 1991. 24p. Order Number DE93604063. Source: OSTI; NTIS (US Sales Only); INIS.

Iterative solutions to linear systems of equations are discussed. The emphasis is on the concepts that affect convergence rates of these solution methods. The multigrid method is described, including the smoothing property, restriction, and prolongation. A simple example is used to illustrate the ideas.

2413 (ANL/CP–75674) **The design of the AIE: An object-oriented application development system.** Fuja, R.S.; Widing, M.A. Argonne National Lab., IL (United States). 27 Feb 1992. 20p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-921084–2: Conference on object-oriented programming systems, languages, and applications, Vancouver (Canada), 18-22 Oct 1992). Order Number DE92041098. Source: OSTI; NTIS; GPO Dep.

Three years ago, in response to our challenging development context, the Advanced Modeling and Analysis Section designed and implemented an object-oriented environment -- the Application Interface Engine (AIE). Our prototyping requirements forced existing application development systems beyond their capabilities. Programmers at AMAS and its contractors have developed over twenty applications using AIE. Our initial experience has been very positive. AIE extends an object-oriented programming language with syntax and classes to support applications specification. This extended system improves all stages of the application engineering life cycle, from rapid prototyping to long term maintenance.

2414 (ANL/CP–76898) **ADIFOR: A Fortran system for portable automatic differentiation.** Bischof, C.; Griewank, A. Argonne National Lab., IL (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9209215–1: 4. AIAA USAF/NASA/OAI symposium on multidisciplinary analysis and optimization, Cleveland, OH (United States), 21-23 Sep 1992). Order Number DE92040743. Source: OSTI; NTIS; GPO Dep.

Automatic differentiation provides the foundation for sensitivity analysis and subsequent design optimization of complex systems by reliably computing derivatives of large computer codes, with the potential of doing it many times faster compared to current approaches. This paper describes the ADIFOR (Automatic DIfferentiation of FORtran) system, a translator that augments Fortran programs with statements for the computation of derivatives. ADIFOR accepts arbitrary Fortran 77 code defining the computation of a function and writes portable Fortran 77 code for the computation of its derivatives. Our goal is to free the computational scientist from worrying about the accurate and efficient computation of derivatives, even for complicated "functions," thereby enabling him to concentrate on the more important issues of system modeling and algorithm design. This paper gives an overview of the principles underlying the ADIFOR system, and comments on the power of automatic differentiation for computing derivatives of implicitly-defined functions.

2415 (ANL/CP–77114) **Domain decomposition as a mechanism for using asymptotic methods.** Gropp, W.D. (Argonne National Lab., IL (United States)); Keyes, D.E. Argonne National Lab., IL (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9205253–1: NATO workshop on numerical methods for partial differential equations and critical parameters, Beaune (France), 25-28 May 1992). Order Number DE92040759. Source: OSTI; NTIS; GPO Dep.

This paper summarizes some recent advances in numerical analysis for PDEs, particularly those in algebraic domain decomposition techniques, and demonstrates how such methods may be combined with asymptotic methods to provide robust and effective solvers.

2416 (ANL/MCS-TM–168) **ADIFOR case study: VODE + ADIFOR: ADIFOR working note No. 10.** Corliss, G. Argonne National Lab., IL (United States). Aug 1992. 10p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93000894. Source: OSTI; NTIS; GPO Dep.

ADIFOR can be used to generate the Jacobians required by VODE in a manner that is easy to use. We provide a template to interface the ADIFOR-generated code with VODE and show how the template is used in a sample system of stiff ordinary differential equation. The ADIFOR-generated code is about 10% faster than the hand-coded Jacobian for this example.

2417 (BARC–1991/E/023) **A static analysis tool set for assembler code verification.** Dhodapkar, S.D. (Bhabha Atomic Research Centre, Bombay (India). Reactor Control Div.); Bhattacharjee, A.K.; Sen, Gopa. Bhabha Atomic Research Centre, Bombay (India). 1991. 46p. Order Number DE93606012. Source: OSTI; NTIS (US Sales Only); INIS.

Software Verification and Validation (V and V) is an important step in assuring reliability and quality of the software. The verification of program source code forms an important part of the overall V and V activity. The static analysis tools described here are useful in verification of assembler code. The tool set consists of static analysers for Intel 8086 and Motorola 68000 assembly language programs. The analysers examine the program source code and generate information about control flow within the program modules, unreachable code, well-formation of modules, call dependency between modules etc. The analysis of loops detects unstructured loops and syntactically infinite loops. Software metrics relating to size and structural complexity are also computed. This report describes the salient features of the design, implementation and the user interface of the tool set. The outputs generated by the analyser are explained using examples taken from some projects analysed by this tool set. (author). 7 refs., 17 figs.

2418 (BNL–47892) **Uniform convergence estimates for multigrid V-cycle algorithms with less than full elliptic regularity.** Bramble, J.H.; Pasciak, J.E. Brookhaven National Lab., Upton, NY (United States). Mar 1992. 10p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC02-76CH00016. Grant DMS84-05352;Grant DMS88-05311-04. (CONF-9206290–1: 6. international conference on domain decomposition methods in science and engineering, Como (Italy), 14-21 Jun 1992). Order Number DE92041275. Source: OSTI; NTIS; GPO Dep.

In this paper, we provide uniform estimates for V-cycle algorithms with one smoothing on each level. This theory is based on some elliptic regularity but does not require a smoother interaction hypothesis (sometimes referred to as a strengthened Cauchy Schwarz inequality) assumed in other theories. Thus, it is a natural extension of the full regularity V-cycle estimates provided by Braess and Hackbush.

2419 (CONF-9208159–1) **Hermite interpolation algorithm for 2D fracture mechanics.** Potyondy, D.O. (Cornell Univ., Ithaca, NY (United States)); Ingraffea, A.R.; Gray, L.J. 2420 (DOE/MC/24207–2995) **Development of algorithms for capacitance imaging techniques for fluidized bed flow fields: 1990 Annual report.** Loudin, W.J. West Virginia Univ., Morgantown, WV (United States). Dept. of Mathematics. Jan 1991. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-87MC24207. Order Number DE91002076. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to provide support for the instrumentation concept of a High Resolution Capacitance Imaging System (HRCIS). The work involves the development and evaluation of the mathematical theory and associated models and algorithms which reduce the electronic measurements to valid physical characterizations. The research and development require the investigation of techniques to solve large systems of equations based on capacitance measurements for various electrode configurations in order to estimate densities of materials in a cross-section of a fluidized bed. Capacitance measurements are made for 400 connections of the 32-electrode system; 400 corresponding electric-field curves are constructed by solving a second order partial differential equation. These curves are used to partition the circular disk into 193 regions called pixels, and the density of material in each pixel is to be estimated. Two methods of approximating densities have been developed and consideration of a third method has been initiated. One method (Method 1) is based on products of displacement currents for intersecting electric-field curves on a cross section. For each pixel one point of intersection is chosen, and the product of the capacitance measurements is found. Both the product and the square-root-of-product seem to yield good relative distribution of densities.

2421 (ESTSC–000434IBMPC00) **AMFU: Alternative motor fuel use model.** Green, D. (Oak Ridge National Lab, TN (United States)); Rathi, A. Oak Ridge National Lab., TN (United States). 1 Mar 1990. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Source: ESTSC.

Description: IBM PC; MS-DOS Version 2.1 or higher; Compiled BASIC.

AMFU is a tool for the analysis and prediction of motor fuel use by highway vehicles. The model advances the art of vehicle stock modeling by including a representation of the choice of motor fuel for flexible and dual fuel vehicles.

2422 (ESTSC–000440CY00000) **FEFF 5.03: Ab initio X-ray Absorption Fine Structure Code.** Zabinsky, S.I. (University of Washington, Seattle, WA (United States)); Rehr, J.J.; Albers, R.C. Washington Univ., Seattle, WA (United States). 27 Apr 1992. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER45415. Source: ESTSC.

Description: CRAY; Designed to be portable; FORTRAN 77; One 3.5 diskette.

FEFF5.03 calculates single and multiple-scattering curved wave XAFS spectra, phase shifts and effective scattering amplitudes for cluster of atoms.

2423 (ESTSC–000440IBMPC00) **FEFF 5.03: Ab initio X-ray Absorption Fine Structure Code.** Zabinsky, S.I. (University of Washington, Seattle, WA (United States)); Rehr, J.J.; Albers, R.C. Washington Univ., Seattle, WA (United States). 27 Apr 1992. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER45415. Source: ESTSC.

Description: IBM PC; Designed to be portable; FORTRAN 77; One 3.5 diskette.

FEFF5.03 calculates single and multiple-scattering curved wave XAFS spectra, phase shifts and effective scattering amplitudes for cluster of atoms.

2424 (ESTSC–000440MNFRM00) **FEFF 5.03: Ab initio X-ray Absorption Fine Structure Code.** Zabinsky, S.I. (University of Washington, Seattle, WA (United States)); Rehr, J.J.; Albers, R.C. Washington Univ., Seattle, WA (United States). 27 Apr 1992. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER45415. Source: ESTSC.

Description: MAINFRAMES; Designed to be portable; FORTRAN 77; One 3.5 diskette.

FEFF5.03 calculates single and multiple-scattering curved wave XAFS spectra, phase shifts and effective scattering amplitudes for cluster of atoms.

2425 (ESTSC–000460IPCAT00) **MAILS: Multiple-Aircraft Instantaneous Line Source.** Liebsch, E.J. (Oak Ridge National Lab, TN (United States)); Miller, R.L. Oak Ridge National Lab., TN (United States). 1 Mar 1991. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Source: ESTSC.

Description: IBM PC/AT; PC-DOE or MS-DOS; FORTRAN IV; 1 5.25 Diskette.

MAILS is an air-quality screening model, that provides conservative estimates of ground-level pollutant concentrations resulting from aircraft engine emissions along low-altitude (under 3000 ft) military training routes (MTRs). It was developed to evaluate the air-quality impacts of proposed MTRs, in accordance with the environmental-impact analysis requirements of the National Environmental Policy Act of 1969 (NEPA, Pub.L. 91-190).

2426 (ESTSC–000461AL00000) **SXLSQA: For the interpretation of solvent extraction data.** Baes, C.F. Jr (Oak Ridge National Lab., TN (United States)); Moyer, B.A. Oak Ridge National Lab., TN (United States). 8 Jun 1992. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Source: ESTSC.

Description: APPLE MACINTOSH; MACINTOSH FINDER 6.1.5, SYSTEM 6FORTRAN 77; 1 3.5 Diskette. The input and output file names are specified by the program. This software is still under development and has not been completely debugged. Users are requested to report any problems they encounter to aid the authors in improving SXLSQA.

SXLSQA models solvent extraction systems involving an acidic and/or a neutral reagent in an organic solvent that can extract from an aqueous solution one or two cations in addition to H plus and one or two anions in addition to OH minus. In modelling data, any number of product species can be assumed to form in either phase. Activity coefficients of species in the aqueous phase can be calculated by the Pitzer treatment and in the organic phase by Hildebrand-Scott treatment.

2427 (ESTSC–000461D0VAX00) **SXLSQA: For the interpretation of solvent extraction data.** Baes, C.F. Jr (Oak Ridge National Lab., TN (United States)); Moyer, B.A. Oak Ridge National Lab., TN (United States). 8 Jun 1992. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Source: ESTSC.

Description: DEC VAX; VAX; FORTRAN 77; 1 3.5 Diskette. The input and output file names are specified by the program. This software is still under development and has not been completely debugged. Users are requested to report any problems they encounter to aid the authors in improving SXLSQA.

2428 (ESTSC–000507C660000) **LASLXSECSETS: Sn 18-24- and 25-group sets.** Mills, C.B. (Los Alamos National Lab., NM (United States)). Los Alamos National Lab., NM (United States). 1 Sep 1963. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (NESC–532). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: CDC6600; SCOPE; FORTRAN IV; 1 Mag Tape.

Group constants and computed neutron cross sections are tabulated for a variety of materials including - Al, B, Be, C, Cd, Cl, D, Ga, F194, Fe, H, K, Li6, Mo, Na, Ni, O, Pu239, Pu240, Pu249, Th, U233, U235, U238, and Zr. These are presented as 18-, 24-, and 25-group calculations for reactors with neutron energies ranging from fast to thermal.

2429 (ESTSC–000508U110000) **ISOTOPES: Maximum yield from reaction or decay.** Furman, A. (Lockheed Missiles and Space Co., Sunnyvale, CA (United States)). Oak Ridge National Lab., TN (United States). 1 Jan 1965. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (NESC–179). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: UNIVAC1100; EXEC8; FORTRAN V; 1 Mag Tape. The input is unchanged from that described in ORNL-3673, except for the use of one blank card to separate cases and two blank cards to terminate a run.

This program can be used to calculate for any neutron flux the optimum time of irradiation for maximum yield, the specific activity of the product isotope in curies per gram of target material, and the combined specific activity of the target and product isotopes. The product isotope may be produced by any simple reaction such as (n,gamma), (n,p), (n,2n), etc., or it may be produced by decay of a parent isotope.

2430 (ESTSC–000509C007400) **LAYFLO: Radionuclide transport geologic medium.** Gureghian, A.B. (Battelle Memorial Institute, Columbus, OH (United States)); Jansen, G. Battelle Memorial Inst., Columbus, OH (United States). Office of Nuclear Waste Isolation. 1 May 1983. Sponsored by USDOE, Washington, DC (United States). (NESC–1038). Source: ESTSC.

Description: CDC CYBER74; NOS/BE 1.5 (CDC CYBER74); NOS 1.FORTRAN 77; 1 Mag Tape. The VAX version of LAYFLO and auxiliary graphic program mentioned in the ONWI-466 reference report are not available from the authors.

LAYFLO predicts the one-dimensional convective-dispersive and nondispersive transport of a three-member decay chain in a stratified geologic medium. The dispersive solution is restricted to six layers, while the nondispersive solution can handle any number of layers. The accuracy of LAYFLO was tested on a selected number of problems for which analytical solutions or experimental data were available.

2431 (ESTSC–000510I036000) **INCITE: thermal spectra & multi-gp constants.** Curtis, R.L. (EG and G Idaho Inc., Idaho Falls, ID (United States)); Grimesey, R.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1 Nov 1967. Sponsored by USDOE, Washington, DC (United States). (NESC–565). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: IBM360; OS/360; FORTRAN IV; 1 Mag Tape.

INCITE generates energy-dependent thermal neutron spectra and appropriate average multigroup cross sections using arbitrary scattering kernels. The physical model is a homogeneous, critical, one-dimensional base slab core.

2432 (ESTSC–000511I036000) **KEFFMGBSTGAN: nuclear criticality safety.** Clark, H.K. (Westinghouse Savannah River Co., Aiken, SC (United States)). Westinghouse Savannah River Co., Aiken, SC (United States). 1 Nov 1967. Sponsored by USDOE, Washington, DC (United States). (NESC–617). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: IBM360; OS/360; FORTRAN IV; 1 Mag Tape.

Three codes for nuclear criticality safety evaluations make up this package. The principal codes are a code for computing the buckling of fissile material moderated by water (MGBS) and a two-group diffusion theory code that uses parameters generated by the buckling code (TGAN). KEFF is an auxiliary code. KEFF computes keff from dimensions and extrapolation distances, or alternative dimensions, volumes, and masses corresponding to values of keff.

2433 (ESTSC–000512I036000) **ISOSEARCH: Isotope production flux, x-sec calc.** Friend, C.W. (Oak Ridge National Lab., TN (United States)); Lewis, R.E.; Jenkins, A.R. Oak Ridge National Lab., TN (United States). 1 Jan 1967. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (NESC–322). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: IBM360; Machine dependent; FORTRAN IV and BAL; 1 Mag Tape.

The program was developed to calculate the unknown reaction cross section, flux value, or product activity in an isotope-production scheme consisting of two or three nuclides.

2434 (ESTSC–000516C017600) **MMT: 1-d radionuclide ground water transport.** Golis, M.J. (Battelle Memorial Institute, Columbus, OH (United States)). Battelle, Columbus, OH (United States). 1 Apr 1983. Sponsored by USDOE, Washington, DC (United States). (NESC–9853). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: CDC CYBER176; NOS 1.4 (CDC CYBER176); NOS 2 (CFORTRAN 77 (FTN5); 1 Mag Tape. PLTCVT uses routines from the proprietary CalComp library to produce graphical output; these routines are not included.

MMT solves the one-dimensional equation for transport of radionuclides in a ground-water system with uniform velocity and transport properties. The purpose of the code is to evaluate radionuclide release rates from the site subsystem. MMT treats convective transport, sorption-desorption effects, and hydrodynamic dispersion. Sorption and desorption of radionuclides are taken into account by application of retardation factors which are spatially uniform and derived from bulk rock properties and average geochemical data. Dispersion along the direction of flow (forward and backward) is also taken into account. Because the code solves only the one-dimensional transport equation, dispersion transverse to the direction of flow is not evaluated. A discrete parcel random walk (DPRW) approach is used to solve the coupled equations. This numerical technique is inherently stable and minimizes computational errors that lead to apparent mass nonconservation. MMT is a set of three programs which are run sequentially. The first program, MMT1D, utilizes flow and radionuclide input to generate the raw radionuclide release rate output in terms of the frequency at which parcels pass the specified release point and the calculated weights of these parcels. The second program, PLTCVT, is a post-processor which filters and smooths the MMT1D output to reduce the statistical fluctuation. PLTCVT uses a variable-window, moving-average filter algorithm to smooth the raw results. The smoothed output from PLTCVT consists of separate, smoothed output files for each nuclide under consideration. The third program, MERGE, merges the separate release files generated by PLTCVT into a single output file. This merged output file may be used directly by a biosphere transport or dose assessment code as radionuclide release rate input data.

2435 (ESTSC–000517D078000) **MASCOT: Radionuclide decay chain transport.** Gureghian, A.B. (Battelle Memorial Institute, Columbus, OH (United States)). Battelle, Willowbrook, IL (United States). Office of Waste Technology Development. 1 Jul 1988. Sponsored by USDOE, Washington, DC (United States). (NESC–9522). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: DEC VAX11/780; VMS 4.1; VAX FORTRAN; 1 Mag Tape. The MAS-GRF postprocessor requires the proprietary CA-DISSPLA 10.0 software to produce graphical results. MAS-GRF can produce tables if DISSPLA is not available. Both MASCOT and MAS-GRF must be compiled using the FORTRAN compiler option, G-FLOATING, which implements extended-range floating-point arithmetic. Other non-standard FORTRAN 77 features include extended-length symbolic names, the END DO statement, and calls to system DATE and TIME routines.

MASCOT computes the two- and three-dimensional space-time dependent, convective-dispersive transport of a four-member radionuclide decay chain in unbounded homogeneous porous media for constant (step and band) and radionuclide-dependent release. A steady-state isothermal groundwater flow regime is assumed with parallel streamlines along the direction of flow. The solutions are designed for an unbounded medium flow field assumed to be semi-infinite normal to the source and infinite orthogonal to the source with a variety of boundary conditions, including a single or multiple finite line source or a Gaussian-distributed source in the two-dimensional case, and a single or multiple patch source or bivariate-normal distributed source in the three-dimensional case. A postprocessor prográm, MAS-GRF, which produces tables and/or graphs from MASCOT output, is included.

2436 (ESTSC–000518U110800) **TOAD: Processing of analyzer gamma-ray spectra.** Busch, D.D. (General Atomic Co., San Diego, CA (United States)). General Atomics, San Diego, CA (United States). 3 Apr 1968. Sponsored by USDOE, Washington,

DC (United States). (NESC–333). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: UNIVAC1108; EXEC2; GAX33; FORTRAN IV and Assembly language; 1 Mag Tape.

TOAD is used to process and analyze gamma ray spectra.

2437 (ESTSC–000519IPCAT00) **RICKI: Interactive gamma spectral analysis.** Proctor, A.E. (EG and G Idaho Inc., Idaho Falls, ID (United States)). EG and G Idaho, Inc., Idaho Falls, ID (United States). 1 Feb 1987. Sponsored by USDOE, Washington, DC (United States). (NESC–9580). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: IBM PC/AT; DOS 3.1; IBM BASIC 2.01; 1 5.25 Diskette. Because some DOS systems do not allow more than three open files, two RICKI source files are provided. RICKI2 edits the averaged activities and procedures output file (the fourth open file) for use by the CORESORT spreadsheet generation program. RICKI, which does not perform this editing, opens only three files.

RICKI is an interactive program for analysis of gamma spectra containing one or more peaks with possible multiplets. Algorithms are incorporated for peak fitting, analysis, and nuclide identification. Comprehensive output keeps the user informed of the analysis as it proceeds and presents the results. User-selectable options for plotting and neutron activation analysis are available to control this analysis. RICKI was developed to analyze spectra from examinations of severe fuel damage specimens. Two features included to streamline the analysis of Three Mile Island (TMI) core bore data are the edit of averaged activities and the output file created for generating a spreadsheet. Activity editing allows the user to select which gamma lines are used for a specific nuclide in average activity calculations. Contributions from peak areas which result from overlapping lines of two or more nuclides may be removed. For each averaged activity an edited activity file record is written containing the nuclide name, averaged activity, activity standard deviation, scan start position, and scan end position.

2438 (ESTSC–000520I036000) **THERMOS: 30-gp ENDF/B scat kernels.** McCrosson, F.J. (Westinghouse Savannah River Plant, Aiken, SC (United States)); Finch, D.R. Westinghouse Savannah River Co., Aiken, SC (United States). 1 Oct 1971. Sponsored by USDOE, Washington, DC (United States). (NESC–543). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: IBM360; Machine Dependent; Auxiliary program written in FORTRAN IV; 1 Mag Tape.

These data are 30-group THERMOS thermal scattering kernels for P0 to P5 Legendre orders for every temperature of every material from s(alpha,beta) data stored in the ENDF/B library. These scattering kernels were generated using the FLANGE2 computer code (NESC 368). To test the kernels, the integral properties of each set of kernels were determined by a precision integration of the diffusion length equation and compared to experimental measurements of these properties. In general, the agreement was very good. Details of the methods used and results obtained are contained in the reference. The scattering kernels are organized into a two volume magnetic tape library from which they may be retrieved easily for use in any 30-group THERMOS library.

2439 (ESTSC–000521GE63500) **REAX: Resolved resonance epithermal x-sections.** Protsik, R. (General Electric Co., Sunnyvale, CA (United States)). General Electric Co., San Jose, CA (United States). Nuclear Energy Products Div. 1 Apr 1966. Sponsored by USDOE, Washington, DC (United States). (NESC–257). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: GE635; GE635 GECOS; FORTRAN IV; 1 Mag Tape.

REAX calculates epithermal flux, activities and cross sections as a function of radius and energy for a constant temperature fuel rod immersed in a homogeneous medium.

2440 (ESTSC–000522I036000) **REBUS2: Fuel cycle analysis for fast reactors.** Toppel, B.J. (Argonne National Lab., IL (United States)). Argonne National Lab., IL (United States). 1 Oct 1978. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (NESC–634). Source: ESTSC.

Description: IBM360; OS/360;370; FORTRAN IV (99%) and Assembly language (1%); 1 Mag Tape.

REBUS2 is a system of codes designed for the analysis of fast reactor fuel cycles. Two basic types of analysis problems are solved–the infinite-time, or equilibrium, conditions of a reactor operating under a fixed fuel management scheme, and the explicit cycle-by-cycle, or nonequilibrium, operation of a reactor under a specified periodic fuel management program. For the equilibrium type problems, the code uses specified external fuel supplies to load the reactor. Optionally, reprocessing may be included in the specification of the external fuel cycle and discharged fuel may be recycled back into the reactor. For non-equilibrium cases, the initial composition of the reactor core may be explicitly specified or the core may be loaded from external feeds as in equilibrium problems. Three types of search procedures may be carried out in order to satisfy user-supplied constraints - (a) adjustment of the reactor burn cycle time to achieve a specified discharge burnup, (b) adjustment of the fresh fuel enrichment to achieve a specified multiplication constant at a specified point during the burn cycle, and (c) adjustment of the control poison density to maintain a specified value of the multiplication constant throughout the reactor burn cycle.

2441 (ESTSC–000522MNFRM00) **REBUS2: Fuel cycle analysis for fast reactors.** Toppel, B.J. (Argonne National Lab., IL (United States)). Argonne National Lab., IL (United States). 1 Oct 1978. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (NESC–634). Source: ESTSC.

Description: MAINFRAMES; OS/360;370; FORTRAN IV (99%) and Assembly language (1%); 1 Mag Tape. This version is for non IBM 360 users.

REBUS2 is a system of codes designed for the analysis of fast reactor fuel cycles. Two basic types of analysis problems are solved–the infinite-time, or equilibrium, conditions of a reactor operating under a fixed fuel management scheme, and the explicit cycle-by-cycle, or nonequilibrium, operation of a reactor under a specified periodic fuel management program. For the equilibrium type problems, the code uses specified external fuel supplies to load the reactor. Optionally, reprocessing may be included in the specification of the external fuel cycle and discharged fuel may be recycled back into the reactor. For non-equilibrium cases, the initial composition of the reactor core may be explicitly specified or the core may be loaded from external feeds as in equilibrium problems. Three types of search procedures may be carried out in order to satisfy user-supplied constraints - (a) adjustment of the reactor burn cycle time to achieve a specified discharge burnup, (b) adjustment of the fresh fuel enrichment to achieve a specified multiplication constant at a specified point during the burn cycle, and (c) adjustment of the control poison density to maintain a specified value of the multiplication constant throughout the reactor burn cycle.

2442 (ESTSC–000523C760000) **UCBNE25: radionuclide migration geologic media.** Kilshtok, G. (Battelle Columbus Labs., OH (United States)). Battelle, Columbus, OH (United States). 1 Oct 1980. Sponsored by USDOE, Washington, DC (United States). (NESC–9667). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: CDC7600; NOS; FORTRAN (CDC FTN5); 1 Mag Tape.

UCBNE25 estimates the maximum concentration of nuclides occurring during the migration of three-member radionuclide chains in geologic media without axial dispersion. Unlike other migration codes, the release rate in UCBNE25 is the independent variable, and time is the dependent variable. The extrema in concentrations are determined without having to calculate the entire concentration history. The program assumes one-dimensional water transport and sorption equilibrium for the nuclides in the soil and in the water. The water velocity is held constant, and the leach times are smaller than the half-lives of the nuclides involved. UCBNE25 calculates for each nuclide the time of the maxima at a specified position, the maximum dimensionless concentration, the corresponding water dilution rate, and the contamination time for that position. The closed form solutions can be easily checked by hand, making it a useful calibration tool for other codes.

2443 (ESTSC–000524D078000) **UCBNE10.4: radionuclide migration porous media.** Pigford, T.H. (University of California, Berkeley, CA (United States)); Light, W.B. California Univ., Berkeley, CA (United States). Dept. of Nuclear Engineering. 1 Feb 1980.

Sponsored by USDOE, Washington, DC (United States). (NESC–9668). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: DEC VAX11/780; NOS; FORTRAN 77; 1 Mag Tape.

UCBNE10.2 calculates the one-dimensional migration of radionuclides in a three-member chain in a geological medium saturated with ground water. The geological medium is considered to be a composite material, which consists of solid and liquid phases, and the transport of radionuclides along the interface between the two phases is neglected. The various possible release modes which can be considered include the band, the step, the preferential release, and the exponential. Radioactive waste is viewed as consisting of radionuclides dispersed through a solid matrix. A finite dissolution rate of the waste material results in a band release of radionuclides into the ground water; it is assumed that all of the waste material begins to dissolve at time, t=0, and dissolution is complete with a leach time, T. When the band-release time T approaches infinity, the release mode becomes a step release; it is assumed that the waste material dissolves at a finite rate over an infinite period. On physical grounds, waste material may reasonably be expected to dissolve at an infinitesimal rate in the case of a step release. The preferential release mode assumes that each radionuclide leaches from the waste at a constant fractional rate which is nuclide-dependent. If all species dissolve at the same fractional rate, i.e. all have the same fractional rate constant, this becomes the exponential release mode. Either of two forms of output may be selected. The first produces normalized nuclide and radioactivity concentrations; the second generates radioactivity and ingestion hazard discharge rates.

2444 (ESTSC–000525IBMPC00) **COSTSAFR3.0: Yearly energy costs for buildings.** Lucas, R. (Battelle Pacific Northwest Lab., Richland, WA (United Sates)). Pacific Northwest Lab., Richland, WA (United States). 1 Jun 1988. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (NESC–9405). Source: ESTSC.

Description: IBM PC; MS DOS 2.0 or later; C; 4 5.25 Diskettes. Key Software Products Optimizer (Version 2.5h) is needed to link the code due to the size of the code.

COSTSAFR3.0 generates a set of compliance forms which will be attached to housing Requests for Proposals (RFPs) issued by Departments or Agencies of the Federal Government. The compliance forms provide a uniform method for estimating the total yearly energy cost for each proposal. COSTSAFR3.0 analyzes specific housing projects at a given site, using alternative fuel types, and considering alternative housing types. The program is designed around the concept of minimizing overall costs through energy conservation design, including first cost and future utility costs, and establishes a standard design to which proposed housing designs are compared. It provides a point table for each housing type that can be used to determine whether a proposed design meets the standard and how a design can be modified to meet the standard.

2445 (ESTSC–000528C660000) **RAMP1: Reich-Moore resolved region x-sections.** Bhat, M.R. (Brookhaven National Lab., Upton, NY (United States)). Brookhaven National Lab., Upton, NY (United States). 1 Dec 1971. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (NESC–492). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: CDC6600; SCOPE 3.0; FORTRAN IV; 1 Mag Tape.

RAMP1 calculates scattering, capture, fission, and total cross sections from Reich-Moore resolved resonance parameters. The resonance parameters are assumed to be in ENDF/B Version II data format. Cross sections may be Doppler-broadened if so desired.

2446 (ESTSC–000531C760000) **SCAP: Point kernel single or albedo scatter.** Disney, R.K. (Westinghouse Electric Corp., Madison, PA (United States)); Bevan, S.E. Westinghouse Electric Corp., Madison, PA (United States). Advanced Reactors Div. 1 Feb 1981. Sponsored by USDOE, Washington, DC (United States). (NESC–933). Source: ESTSC.

Description: CDC7600; SCOPE 2.1 (CDC7600); NOS 1.3 (CDC-FORTRAN (99%) and COMPASS (1%); 1 Mag Tape. Subroutine RFLS, which allocates the requested small core memory (SCM), is written in CDC COMPASS assembly language.

SCAP solves for radiation transport in complex geometries using the single or albedo-scatter point kernel method. The program is designed to calculate the neutron or gamma-ray radiation level at detector points located within or outside a complex radiation scatter source geometry or a user-specified discrete scattering volume. The geometry is described by zones bounded by intersecting quadratic surfaces with an arbitrary maximum number of boundary surfaces per zone. The anisotropic point sources are described as pointwise energy dependent distributions of polar angles on a meridian; isotropic point sources may be specified also. The attenuation function for gamma rays is an exponential function on the primary source leg and the scatter leg with a buildup factor approximation to account for multiple scatter on the scatter leg. The neutron attenuation function is an exponential function using neutron removal cross sections on the primary source leg and scatter leg. Line or volumetric sources can be represented as distributions of isotropic point sources, with uncollided line-of-sight attenuation and buildup calculated between each source point and the detector point.

2447 (ESTSC–000533C018000) **WIMS-D/4: Multigroup reactor lattice cell calculation.** Roth, M.J. (United Kingdom Atomic Energy Authority, Winfrith (United Kingdom)). Brookhaven National Lab., Upton, NY (United States). 1 Dec 1989. Sponsored by UKAEA Headquarters, London (United Kingdom). (NESC–NEA0329). Source: ESTSC.

Description: CDC CYBER180; NOS 4.3; FORTRAN 77; 1 Mag Tape. Memory must be preset to zero prior to running WIMS-D/4 on a CDC.

WIMS, the Winfrith Improved Multigroup Scheme, is a general program for reactor lattice cell calculations over a wide range of reactor systems. The program accepts rod or plate fuel geometries in either regular arrays or in clusters, and the energy group structure has been chosen for both thermal and fast reactor calculations. The basic library has been compiled with 14 fast groups, 13 resonance groups and 42 thermal groups, but the user is offered the choice of accurate solutions in many groups or rapid calculations in few groups. Temperature dependent thermal scattering matrices for a variety of scattering laws are available in the library for the principal moderators including hydrogen, deuterium, graphite, beryllium and oxygen. The output provides eigenvalues for cases where a simple buckling mode is applicable or cell-averaged parameters for use in overall reactor calculations. Various reaction rate edits are produced for direct comparison with experimental measurements. An auxiliary program WRITER translates the library data from decimal to binary format.

2448 (ESTSC–000533DVX1100) **WIMS-D/4: Multigroup reactor lattice cell calculation.** Roth, M.J. (United Kingdom Atomic Energy Authority, Winfrith, (United Kingdom)). Brookhaven National Lab., Upton, NY (United States). 1 Dec 1989. Sponsored by UKAEA Headquarters, London (United Kingdom). (NESC–NEA0329). Source: ESTSC.

Description: DEC VAX11; VMS; FORTRAN 77; 1 Mag Tape. The DEC VAX version includes WIMSLIB, an extension of the WIMS library for PWR calculations. Control rod materials (Ag, In, Cd) were added or replaced; new data for H, Pu-241, U-235, and U-238 are included; and some materials: H(ID=4001), D(4002, 5002, 8002, 9002), B(1010, 1011), Th-232(232, 1232), U-233(233), U-238(238,1238), Pu-239(239, 1239, 2239), and Pu-241(240) were removed. WRITER is used to generate the WIMSLIB binary library.

WIMS, the Winfrith Improved Multigroup Scheme, is a general program for reactor lattice cell calculations over a wide range of reactor systems. The program accepts rod or plate fuel geometries in either regular arrays or in clusters, and the energy group structure has been chosen for both thermal and fast reactor calculations. The basic library has been compiled with 14 fast groups, 13 resonance groups and 42 thermal groups, but the user is offered the choice of accurate solutions in many groups or rapid calculations in few groups. Temperature dependent thermal scattering matrices for a variety of scattering laws are available in the library for the principal moderators including hydrogen, deuterium, graphite, beryllium and oxygen. The output provides eigenvalues for cases where a simple buckling mode is applicable or cell-averaged parameters for use in overall reactor calculations. Various reaction rate edits are produced for direct comparison with experimental measurements.

An auxiliary program WRITER translates the library data from decimal to binary format.

2449 (ESTSC–000533I309000) **WIMS-D/4: Multigroup reactor lattice cell calculation.** Roth, M.J. (United Kingdom Atomic Energy Authority, Winfrith, (United Kingdom)). Brookhaven National Lab., Upton, NY (United States). 1 Dec 1989. Sponsored by UKAEA Headquarters, London (United Kingdom). (NESC–NEA0329). Source: ESTSC.

Description: IBM3090; MVS/XA (IBM3090); VM/CMS (IBM433FORTRAN 77 (97%) and BAL (3%); 1 Mag Tape. The IBM version of WIMS-D/4 uses subroutines ZA02AS, ZA08AS, and ZA09AS from the U.K.A.E.A. Harwell Subroutine Library. These routines, included as part of the package with Harwell's permission, are not in the public domain and extraction for other uses is not permitted.

2450 (ESTSC–000534MNFRM00) **CPS: FNAL cooperative processes software tools.** Biel, J. (Fermi National Accelerator Lab., Batavia, IL (United States)); Isley, M.; Edel, M.; Miranda, M.; Paiva, E. Fermi National Accelerator Lab., Batavia, IL (United States). 1 Mar 1989. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (NESC–9429). Source: ESTSC.

Description: MAINFRAMES; UNIX, ULTRIX,VMS (DEC VAX).; C; 1 Mag Tape.

CPS (Cooperative Processes Software) is a set of software tools for designing applications in which multiple CPUs act on a problem in a cooperative way. CPS is useful on problems which are event-oriented, i.e., they exhibit obvious large degrees of parallelism with loose coupling between individual processes. High energy physics event analysis and triggering farm applications fit this description. Primary tools are a Job Manager program and a set of subroutines. The Job Manager starts the processes, provides common support services, handles errors that occur, keeps track of bookkeeping (state) information about what each process is doing, and stops the processes when the task is over. The subroutines provide mechanisms for interprocess communication, remote subroutine calls, and synchronization.

2451 (ESTSC/NRC–000092I303300) **REFCO83: Nuclear fuel cycle cost economics.** Delene, J.G. (Oak Ridge National Lab., TN (United States)); Hermann, O.W. Oak Ridge National Lab., TN (United States). 1 Jun 1984. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research. (NESC–9820). Source: ESTSC.

Description: IBM3033; OS/MVT;MVS; FORTRAN IV; 1 Mag Tape. A dummy error routine was added to the software to resolve an external call to ERROR. Format statements were fixed to resolve errors of comma placement. The test output was off in precision by only an insignificant fraction.

REFCO83 utilizes a discounted cash flow (DCF) analysis procedure to calculate batch, cycle, and lifetime levelized average nuclear fuel cycle costs. The DCF analysis establishes an energy 'cost' associated with the fuel by requiring that the revenues from the sale of energy be adequate to pay the required return on outstanding capital, to pay all expenses including taxes, and to retire the outstanding investment to zero by the end of the economic life of the set of fuel investments. The program uses reactor mass flow information together with individual fuel cost parameters and utility capital structure and money costs to calculate levelized costs cumulatively through any batch or cycle. A fuel cycle cost component is considered to be any fuel material purchase, processing cost, or discharge material credit in the complete fuel cycle. The costs for each individual component, i.e. uranium, enrichment, etc., may either be expensed or capitalized for tax purposes or, in the case of waste disposal, the cost may also be made proportional to power production. To properly account for the effect of income taxes, all calculations in REFCO83 are done using 'then' current dollars, including price escalations caused by inflation. The database used for the default values for REFCO83 was taken from the Nuclear Energy Cost Data Base. The maximum number of fuel batches is 120. A typical REFCO83 calculation requires about one second of CPU time. REFCO83 is an outgrowth of the original REFCO program, written in the early 1970s, and later releases including the POWERCO and REFCO8 programs.

We describe the method of the analysis of the dependence of the factorial moments on the bin size in which the correlations between the moments computed for different bin sizes are taken into account. For large multiplicity nucleus-nucleus data inclusion of the correlations does not change the values of the slope parameter, but gives errors significantly reduced as compared to the case of fits with no correlations. (author).

2465 (JINR-E–5-91-401) **A REDUCE program for symbolic computation of Puiseux expansions.** Gerdt, V.P.; Tiller, P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. 8p. Order Number DE93606014. Source: OSTI; NTIS (US Sales Only); INIS.

The program is described for computation of Puiseux expansions of algebraic functions. The Newton diagram method is used for construction of initial coefficients of all the Puiseux series at the given point. The program is written in computer algebra language Reduce. Some illustrative examples are given. 20 refs.

The program ANS which is the graphical user friendly program to process evaluated neutron data files for interpretation of transmission experiments. The ANS program was written in the Turbo Pascal v. 5 language and may work on the IBM AT with Math Co-Processor. 3 refs.; 1 fig.

2467 (JINR-R–11-91-327) **Investigation of the increased accuracy order difference schemes for the scattering problem at the quasi-uniform mesh.** Vinitskij, S.I.; Puzynin, I.V.; Smirnov, Yu.S. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. 14p. (In Russian). Order Number DE93606011. Source: OSTI; NTIS (US Sales Only); INIS.

An iteration algorithm for solving the scattering problem is proposed, such that uses the increased accuracy order difference schemes at the quasi-uniform mesh. The dependence of calculated phase shifts on the quasi-uniform mesh structure is investigated. The borders of the increased accuracy order difference schemes application in the scattering problem is defined. The calculation of the location and the width of the $^1P_{0(2.1)}{}^0$+H$^-$ form resonance is executed with the help of the present algorithm. 5 refs.; 7 figs.; 2 tabs.

2468 (LA–12353-MS) **Back propagation neural networks for facial verification.** Garnett, A.E. (ed.); Solheim, I.; Payne, T.;

Castain, R.H. Los Alamos National Lab., NM (United States). Oct 1992. 60p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93001428. Source: OSTI; NTIS; GPO Dep.

We conducted a test to determine the aptitude of neural networks to recognize human faces. The pictures we collected of 511 subjects captured both profiles and many natural expressions. Some of the subjects were wearing glasses, sunglasses, or hats in some of the pictures. The images were compressed by a factor of 100 and converted into image vectors of 1400 pixels. The image vectors were fed into a back propagation neural network with one hidden layer and one output node. The networks were trained to recognize one target person and to reject all other persons. Neural networks for 37 target subjects were trained with 8 different training sets that consisted of different subsets of the data. The networks were then tested on the rest of the data, which consisted of 7000 or more unseen pictures. Results indicate that a false acceptance rate of less than 1 percent can be obtained, and a false rejection rate of 2 percent can be obtained when certain restrictions are followed.

2469 (LA-UR–92-1753) **High speed networks, visualization, and massive parallelism in the Advanced Computing Laboratory.** Forslund, D.W.; Hansen, C.; Hinker, P.; St. John, W.; Tenbrink, S. Los Alamos National Lab., NM (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-921210–2: Symposium for high-performance computing for flight vehicles, Washington, DC (United States), 7-9 Dec 1992). Order Number DE92017412. Source: OSTI; NTIS; GPO Dep.

Very high performance massively parallel machines are now available to solve significant problems for the nation that have been heretofore inaccessible. However, these machines, with their large memories are of little use for these problems without existing in an environment in which the scientist can perceive what is happening in the calculation and analyze the results effectively. This requires being able to transmit enormous amounts of data from these machines through very high performance networks in a way which is easily comprehended and manipulated by the scientist. In order to provide such an environment for these Grand Challenge applications, researchers in the Advanced Computing Laboratory have been developing a very high speed network (100 Mbytes/sec) based on the standard HIPPI protocol developed at Los Alamos. This is used to send data over a multiple crossbar network between supercomputers, high performance graphics machines, and high speed framebuffers. Examples of scientific problems being explored in this way will be given, including approaches to high speed archival data storage and interactive data exploration over these networks.

2470 (LA-UR–92-2338) **Latin hypercube sampling as a tool in uncertainty analysis of computer models.** McKay, M.D. Los Alamos National Lab., NM (United States). [1992]. 9p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-921219–1: 1992 winter simulation conference, Arlington, VA (United States), 13-16 Dec 1992). Order Number DE92018917. Source: OSTI; NTIS; GPO Dep.

This paper addresses several aspects of the analysis of uncertainty in the output of computer models arising from uncertainty in inputs (parameters). Uncertainty of this type, which is separate and distinct from the randomness of a stochastic model, most often arises when input values are guesstimates, or when they are estimated from data, or when the input parameters do not actually correspond to observable quantities, e.g., in lumped-parameter models. Uncertainty in the output is quantified in its probability distribution, which results from treating the inputs as random variables. The assessment of which inputs are important with respect to uncertainty is done relative to the probability distribution of the output.

2471 (LBL–32512) **Monte Carlo simulations on SIMD computer architectures.** Burmester, C.P. (Lawrence Berkeley Lab., CA (United States)); Gronsky, R.; Wille, L.T. Lawrence Berkeley Lab., CA (United States). Mar 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-920402–60: 1992 Material Research Society (MRS) spring meeting, San Francisco, CA (United States), 27 Apr - 2 may 1992). Order Number DE92041210. Source: OSTI; NTIS; GPO Dep.

Algorithmic considerations regarding the implementation of various materials science applications of the Monte Carlo technique to single instruction multiple data (SMM) computer architectures are presented. In particular, implementation of the Ising model with nearest, next nearest, and long range screened Coulomb interactions on the SIMD architecture MasPar MP-1 (DEC mpp-12000) series of massively parallel computers is demonstrated. Methods of code development which optimize processor array use and minimize inter-processor communication are presented including lattice partitioning and the use of processor array spanning tree structures for data reduction. Both geometric and algorithmic parallel approaches are utilized. Benchmarks in terms of Monte Carlo updates per second for the MasPar architecture are presented and compared to values reported in the literature from comparable studies on other architectures.

2472 (NIPER–596) **General-purpose automation programming: A case study on using a graphic language.** Mahmood, S.M.; Olsen, D.K. National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Oct 1992. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-83FE60149. Order Number DE92001071. Source: OSTI; NTIS; GPO Dep.

Object-oriented programming is the future direction of computer programming and automation. It provides fast, easy and very reliable methodology for developing large complicated software programs to test prototype configurations and develop computer control of multiple operations. This report is part of technology transfer to assist the petroleum industry and other engineering, science and manufacturing areas by conveying background information and the benefits of this approach that were acquired during development of the data acquisition/control/analysis/presentation software to operate a high-temperature, high-pressure steamflood laboratory. NIPER developed the background and extensive applications using object-oriented programming software using National Instruments™ LabVIEW®2 as the programming platform. The objective of developing this software was to automate the thermal lab; however, it was designed in such a way that the program would be general and could be configured to any laboratory automation during the run time. This modular program has been constructed so that application, with minor modification, can be used in other laboratory, pilot plant or commercial operations for data acquisition/control/analysist/presentation.

2473 (ORNL/TM–12045) **Exploratory designs for computational experiments.** Morris, M.X.; Mitchell, T.J. Oak Ridge National Lab., TN (United States). Oct 1992. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93002354. Source: OSTI; NTIS; GPO Dep.

Recent work by Johnson, Moore and Ylvisaker (1990) establishes equivalence of the maximin distance design criterion and an entropy criterion motivated by function prediction in a Bayesian setting. The latter criterion has been used by Currin, Mitchell, Morris, and Ylvisaker (1991) to design experiments for which the motivating application is approximation of a complex deterministic computer model. Because computer experiments often have a large number of controlled variables (inputs), maximin designs of moderate size are often concentrated in the corners of the cuboidal design region, i.e. each input is represented at only two levels. Here we will examine some maximin distance designs constructed within the class of Latin hypercube arrangements. The goal of this is to find designs which offer a compromise between the entropy/maximin criterion, and good projective properties in each dimension (as guaranteed by Latin hypercubes). A simulated annealing search algorithm is persented for constructing these designs, and patterns apparent in the optimal designs are discussed.

2474 (ORNL/TM–12125) **A new PICL trace file format.** Worley, P.H. Oak Ridge National Lab., TN (United States). Oct 1992. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93002355. Source: OSTI; NTIS; GPO Dep.

A trace file format is described that will be used in future releases of the Portable Instrumented Communication Library (PICL)

and ParaGraph. The new format provides improved support for tracing and profiling PICL communication primitives and user-defined events. The new format is also easily extended and may be useful in other instrumentation packages and performance visualization tools.

2475 (SAND–92-0508) **Verification of the computer programs SLAAP and DATA.** Cawlfield, J.L.; Smith, E.L. Sandia National Labs., Albuquerque, NM (United States). Oct 1992. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93002597. Source: OSTI; NTIS; GPO Dep.

The computer programs SLAAP and DATA are currently being used by Division 2743 for data analysis. These programs had not been previously verified to determine if they were producing correct results. The objective of the study described in this report was to verify these programs by comparing their results to those obtained with GRAFAID, a verified data analysis program. To accomplish this, five acceleration-time histories were selected. For each time history, the shock response spectrum, integral, double integral, derivative and Fourier transform were computed using SLAAP, DATA and GRAFAID. The results of each operation for each time history were overlay plotted for comparison. The results show only minor differences in some cases. These differences are deterministic and are due to differences in the algorithms or block size restrictions of the three programs.

2476 (SAND–92-0962C) **The Sandia Airborne Computer (SANDAC).** Nava, E.J. Sandia National Labs., Albuquerque, NM (United States). [1992]. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-921210–1: Symposium for high-performance computing for flight vehicles, Washington, DC (United States), 7-9 Dec 1992). Order Number DE92014046. Source: OSTI; NTIS; GPO Dep.

The Sandia Airborne Computer (SANDAC) is a small, modular, high performance, multiprocessor computer originally designed for aerospace applications. It can use a combination of Motorola 68020 and 68040 based processor modules along with AT&T DSP32C based signal processing modules. The system is designed to use up to 15 processors in almost any combination and a complete system can include up to 20 modules. Depending on the mix of processors, total computational throughput can range from 2.5 to greater than 225 Million Instructions Per Second (MIPS). The system is designed so that processors can access all resources in the machine and the inter-processor communication details are completely transparent to the software. In addition to processors, the system includes input/output, memory, and special function modules. Because of its ease of use, small size, durability, and configuration flexibility, SANDAC has been used on applications ranging from missile navigation, guidance, and control systems to medical imaging systems.

2477 (SAND–92-1452) **The performance of PAGOSA on several SIMD and MIMD parallel computers.** Gardner, D.R. (Sandia National Labs., Albuquerque, NM (United States)); Cline, D.D.; Vaughan, C.T.; Krall, R.; Lewitt, M. Sandia National Labs., Albuquerque, NM (United States). Oct 1992. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93002599. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The performance of a single-material version of the PAGO SA code has been measured on various parallel computers. The single-material version of PAGOSA is a three-dimensional, explicit, Eulerian hydrocode for modeling the high-speed hydrodynamic flow of an ideal gas, and was developed at Los Alamos National Laboratory for the Connection Machine-2 (CM-2) massively parallel computer. The performance of the original data-parallel version has been measured on two SIMD machines, the CM-2 and the CM-5, and the performance of a message-passing version developed by Sandia has been measured on five MIMD machines: the Cray Y-MP, the nCUBE 2, the Intel iPSC/860, the Intel Touchstone DELTA, and the CM-5. No special efforts were made to optimize the codes for any particular machine, except that the version Of PAGOSA run on the CM-2 and CM-5 in data-parallel mode is written in CM Fortran; the message-passing version is written in Fortran 77. The scaled speedup results thus show the performance that can be achieved for complex and realistic applications when they are first implemented on parallel computers. Separate measurements of communication and computation time on the nCUBE 2, the iPSC/8 60, the DELTA, and the CM-5 (message-passing mode) reveal whether these machines are limited by the speed of the communication network or the processor speed.

2478 (SAND–92-1460) **An improved spectral graph partitioning algorithm for mapping parallel computations.** Hendrickson, B.; Leland, R. Sandia National Labs., Albuquerque, NM (United States). Sep 1992. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93002593. Source: OSTI; NTIS; GPO Dep.

Efficient use of a distributed memory parallel computer requires that the computational load be balanced across processors in a way that minimizes interprocessor communication. We present a new domain mapping algorithm that extends recent work in which ideas from spectral graph theory have been applied to this problem. Our generalization of spectral graph bisection involves a novel use of multiple eigenvectors to allow for division of a computation into four or eight parts at each stage of a recursive decomposition. The resulting method is suitable for scientific computations like irregular finite elements or differences performed on hypercube or mesh architecture machines. Experimental results confirm that the new method provides better decompositions arrived at more economically and robustly than with previous spectral methods. We have also improved upon the known spectral lower bound for graph bisection.

2479 (SAND–92-1872C) **UNICOS® security system.** Vandevender, W.H. Sandia National Labs., Albuquerque, NM (United States). 17 Sep 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9209204–2: Cray users group meeting, Washington, DC (United States), 14-18 Sep 1992). Order Number DE92040967. Source: OSTI; NTIS; GPO Dep.

Developing security plans and supporting security tests is a very important part of the Department of Energy accreditation process. This paper will discuss the general testing methodology that was used to achieve DOE accreditation of the Secure UNICOS environment at Sandia National Laboratories, Albuquerque. In addition, some specific security testing procedures, test and problem areas will be described.

2480 (SAND–92-2040C) **UniTree, a mass storage solution at Sandia National Laboratories.** Kelly, S.M. Sandia National Labs., Albuquerque, NM (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9209204–3: Cray users group meeting, Washington, DC (United States), 14-18 Sep 1992). Order Number DE92041155. Source: OSTI; NTIS; GPO Dep.

Sandia National Laboratories has recently placed into production a mass storage system based on the UniTree™ Central File Manager software. this paper describes the current status of the system. Background information on the selection criteria is given and the hardware and software configurations are shown. The system has been in production since April, 1992 and the usage and performance statistics, as obtained thus far, are presented.

2481 (SAND–92-2057) **Design and development of an IBM/VM menu system.** Cazzola, D.J. Sandia National Labs., Albuquerque, NM (United States). Oct 1992. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93002512. Source: OSTI; NTIS; GPO Dep.

This report describes a full screen menu system developed using IBM's Interactive System Productivity Facility (ISPF) and the REXX programming language. The software was developed for the 2800 IBM/VM Electrical Computer Aided Design (ECAD) system. The system was developed to deliver electronic drawing definitions to a corporate drawing release system. Although this report documents the status of the menu system when it was retired, the methodologies used and the requirements defined are very applicable to replacement systems.

2482 (SKB-TR–92-01) **GEOTAB. Overview.** Eriksson, E. (SGAB, Luleaa (Sweden)); Stark, T.; Johansson, B.; Magnusson, S.; Gerlach, M.; Sehlstedt, S.; Nilsson, A.C. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1992. 37p. Order Number DE93604069. Source: OSTI; NTIS; INIS.

Since 1977 Swedish Nuclear Fuel and Waste Managements Co., SKB has been performing a research and development program for the final disposal of spent nuclear fuel. One aim of this program is to gain knowledge of different bedrock properties. Measurements for the characterization of geological, geophysical, hydrogeological and hydrochemical conditions are performed in specific site investigations as well as for geoscientific projects. Large volumes of data have been produced since the start of the program, in the form of both raw data and results. During (the course of) the research program this data has been stored in various formats by different institutions and companies performing the investigations. It was therefore decided that all data from the research and development program should be stored in a single database. The database, called Geotab, is a relational database, based on a database handling system from Mimer Information Systems. The application program, also called GEOTAB, was developed by Ergodata. This manual provides a description of the basics of the database and application programs used in connection with GEOTAB. It is intended as an introduction for new and regular users. The database is a mix of information organized so that storage, retrieval and modification of the data is as efficient as possible. GEOTAB is built around a relational database model. (au).

2483 (UCRL-ID–107022-92) **The 1992 MPCI yearly report: Harnessing the killer micros.** Brooks, E.D. III; Heston, B.J.; Warren, K.H.; Woods, L.J. (eds.). Lawrence Livermore National Lab., CA (United States). Aug 1992. 340p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93001831. Source: OSTI; NTIS; GPO Dep.

This report contains a collection of papers on massively parallel computing and applications of this type of processing. (LSP)

2484 (UCRL-JC–110061) **Radial basis functions: A class of grid-free, scattered data approximations.** Kansa, E.J.; Carlson, R.E. Lawrence Livermore National Lab., CA (United States). 20 Mar 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921209–1: International Association Mathematics and Computers Simulation (IAMCS) international symposium on mathematical modelling and computer simulation, Bangalore (India), 7-11 Dec 1992). Order Number DE92012675. Source: OSTI; NTIS; GPO Dep.

Recent developments in the theory and applications of radial basis functions are summarized. One intriguing property of such approximation methods is that rates of convergence improve with increasing dimensions. Also, such approximations, under favorable circumstances, can have exponential convergence. Numerical applications, especially on sparse scattered data sets of high dimensions, validate these theoretical claims.

2485 (UCRL-JC–110450) **Preconditioned time-difference methods for solving advective-diffusive systems.** Rodrigue, G.; Wolitzer, D. Lawrence Livermore National Lab., CA (United States). Apr 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921209–2: International Association Mathematics and Computers Simulation (IAMCS) international symposium on mathematical modelling and computer simulation, Bangalore (India), 7-11 Dec 1992). Order Number DE92014790. Source: OSTI; NTIS; GPO Dep.

Explicit time differencing methods for solving differential equations are advantageous in that they are easy to implement on a computer and are intrinsically very parallel. The disadvantage of explicit methods is the severe restrictions that are placed on stable time-step intervals. Stability bounds for explicit time differencing methods on advective-diffusive problems are generally determined by the diffusive part of the problem. These bounds are very small and implicit methods are used instead. The linear systems arising from these implicit methods are generally solved by iterative methods. In this paper we develop a methodology for increasing the stability bounds of standard explicit finite differencing methods by combining explicit methods, implicit methods, and iterative methods in a novel way to generate new time-difference schemes, called preconditioned time-difference methods. A stability analysis is performed on a particular version of this method for the diffusion equation. Several computational examples of advective-diffusive problems are solved to demonstrate the increased stability limits.

2486 (VTT-TIED–966) **Thermal hydraulic reactor safety analyses and experiments.** Holmstroem, H. (Technical Research Centre of Finland, Espoo (Finland). Nuclear Engineering Lab.); Eerikaeinen, L.; Kervinen, T.; Kilpi, K.; Mattila, L.; Miettinen, J.; Yrjoelae, V. Technical Research Centre of Finland, Espoo (Finland). Apr 1989. 148p. (In Finnish). Order Number DE93606015. Source: OSTI; NTIS; INIS.

The report introduces the results of the thermal hydraulic reactor safety research performed in the Nuclear Engineering Laboratory of the Technical Research Centre of Finland (VTT) during the years 1972-1987. Also practical applications i.e. analyses for the safety authorities and power companies are presented. The emphasis is on description of the state-of-the-art know how. The report describes VTT's most important computer codes, both those of foreign origin and those developed at VTT, and their assessment work, VTT's own experimental research, as well as international experimental projects and other forms of cooperation VTT has participated in. Appendix 8 contains a comprehensive list of the most important publications and technical reports produced. They present the content and results of the research in detail.(orig.).

2487 (ANL/CP–76976) **How scientific must technical editors be?.** Caruthers, C.M. Argonne National Lab., IL (United States). 28 Jul 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9209142–7: Institute of Electrical and Electronics Engineers (IEEE) international professional communications conference (IPCC): crossing frontiers, Santa Fe, NM (United States), 30 Sep 1992). Order Number DE92040741. Source: OSTI; NTIS; GPO Dep.

As a senior technical editor in the Computing and Telecommunications Division at Argonne National Laboratory. I am responsible for a small technical editing group including regular staff, temporary editors, and interns. I have supervised some 22 technical communications interns over the past ten years. Previously, I taught at the university level for 21 years. These experiences have led me to believe that while scientific knowledge in the technical editing process is valuable, it is not essential, but a thorough awareness of verbal structure and intended audience is essential. As I composed this paper, I found myself staring at the posted description of an editing job available in another division at Argonne, prominently requiring "thorough grounding in the basic sciences, including mathematics and physics." This popular assumption–that successful editors of scientific documents must have some expertise in the scientific field to which the documents relate–is, in my judgment, often magnified out of proportion.

2488 (DOE/ER/13815–T1) **Numerical Data Advisory Board annual report, 1988–1989.** National Research Council, Washington, DC (United States). Numerical Data Advisory Board. 1989. 28p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States); National Science Foundation, Washington, DC (United States); National Inst. of Standards and Technology, Gaithersburg, MD (U DOE Contract FG05-87ER13815 ;FG05-82TC11276. Contract 50SBNB8C5167/C;Contract NASW-4102;Contract 467-MZ-90007 Order Number DE93001744. Source: OSTI; NTIS; GPO Dep.

The objective of the Numerical Data Advisory Board (NDAB) and its committees and panels is improvement in the quality, reliability, accessibility, dissemination, utilization, and management of data. NDAB seeks to promote an appreciation of the importance of evaluated data to scientists, engineers, and others who require reliable numerical data for research and for decision making. Delivery of numerical data to the research community is a newly added emphasis of NDAB's program. The Numerical Data Advisory Board is

an interdisciplinary board, with representation form physics, chemistry, engineering, statistics, biosciences, geosciences, and interdisciplinary sciences. Because the goals of NDAB and the goals of CODATA overlap in several ways, NDAB meetings are held in conjunction with meetings of the US National Committee for CODATA (USNC/CODATA), thus informally broadening the representation from each of the disciplines. Lists of members of NDAB and its committees and panels are given in Attachment A.

2489 (IAEA-NDS–7(Rev.92/7)) **Index of nuclear data libraries available from the IAEA Nuclear Data Section.** IAEA-NDS-Documentation Series. Lemmel, H.D. International Atomic Energy Agency, Vienna (Austria). INTOR Group. Jul 1992. 29p. Order Number DE93604056. Source: OSTI; NTIS (US Sales Only); INIS.

This document lists more than 80 nuclear data libraries together with references that give more detailed information about these libraries. All data and documentation references are available upon request from the IAEA Nuclear Data Section, free of charge. (author).

9904 Law

2490 (IAEA-INFCIRC–167(Add.15)) **The text of the agreement to extend the regional co-operative agreement for research, development and training related to nuclear science and technology, 1987.** International Atomic Energy Agency, Vienna (Austria). Sep 1992. 3p. Order Number DE93606003. Source: OSTI; NTIS (US Sales Only); INIS.

Hard copies are available in English, French, Russian and Spanish from IAEA Div. of Publications, Distribution Unit.

The document reproduces the text of the Agreement to Extend the Regional Co-operative Agreement for Research, Development and Training Related to Nuclear Science and Technology, 1987, for a further period of five years with effect from 12 June 1992. Australia, Bangladesh, the People's Republic of China, India, Indonesia, Japan, the Republic of Korea, Malaysia, Pakistan, the Philippines, Singapore, Sri Lanka, Thailand and Viet Nam are parties of this Agreement.

2491 (IAEA-INFCIRC–335(Add.6)) **Convention on early notification of a nuclear accident and convention on assistance in the case of a nuclear accident or radiological emergency.** International Atomic Energy Agency, Vienna (Austria). Sep 1992. 41p. (IAEA-INFCIRC–336(Add.7).). Order Number DE93606004. Source: OSTI; NTIS (US Sales Only); INIS.

Hard copies are available in English, French, Russian and Spanish from IAEA Div. of Publications, Distribution Unit.

The document refers to the Convention on Early Notification of a Nuclear Accident (CENNA) (IAEA-INFCIRC-335) and the Convention on Assistance in the Case of a Nuclear Accident or Radiological Emergency (CANARE) (IAEA-INFCIRC-336). Part I contains the status lists as of 10 September 1992, part II contains the texts of reservations/declarations made upon expressing consent to be bound and objections there to, and part III contains the texts of reservations/declarations made upon signature.

2492 (INIS-mf–13367) **Code on the safety of nuclear power plants: Siting.** Bezpecnost Jadernych Zarizeni. Ceskoslovenska Komise pro Atomovou Energii, Prague (Czechoslovakia). 1992 19p. Translation of IAEA publication (Safety Series No. 50-C-S (Rev. 1)). International Atomic Energy Agency, Vienna 1988. (In Czech). Order Number DE93606005. Source: OSTI; NTIS (US Sales Only); INIS.

This Code provides criteria and procedures that are recommended for safety in nuclear power plant siting. It forms part of the Agency's programme for establishing Codes and Safety Guides relating to land based stationary thermal neutron power plants.

2493 (KAERI/RR–1083/91) **A study on general improvements of the atomic energy law system.** Ham, Chol Hoon (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Sang Won. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1992. 108p. (In Korean). Order Number DE93605964. Source: OSTI; NTIS (US Sales Only); INIS.

This study contains the ethical aspects on nuclear wastes management, the responsibilities in radwastes management, the disposal of low and intermediate level radioactive wastes, the cost of nuclear wastes management and Korean regulatory system of nuclear wastes. The successful development of national nuclear projects depends on the establishment of safe management of wastes. The improvements of safety and regulatory systems on the radwastes as well as amendments of existing law is essential. For the purpose of reference, we appended translated Japanese law. (Author).

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in ETDE/PUB–3, *International Energy: Research Organizations 1986–1990*. Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, indicated by International Organization for Standardization (ISO) country code; and (3) the language of the document if non-English (R;CA;In French). Author affiliations are not listed in this index.

Mild coal pretreatment to improve liquefaction reactivity: Quarterly technical progress report, March–May 1992, 18:31 (R;US)

Colorado School of Mines, Golden, CO (United States). Dept. of Physics
Potential modulation of equilibrium and excitation phenomena at the electrolyte-solid interface: Progress report, October 31, 1991–September 30, 1992, 18:974 (R;US)

Colorado State Univ., Fort Collins, CO (United States). Dept. of Biology
Spatial scaling: Its analysis and effects on animal movements in semiarid landscape mosaics: Final report, 1 September 1988–31 May 1992, 18:1560 (R;US)

Colorado State Univ., Fort Collins, CO (United States). Dept. of Range Science
Nitrogen availability as a control mechanism of secondary succession within a semiarid shrubland ecosystem: Final report, October 1, 1990–June 27, 1992, 18:1559 (R;US)

Colorado Univ., Boulder, CO (United States). Nuclear Physics Lab.
Nuclear Physics Laboratory technical progress report, [August 15, 1991–October 1, 1992], 18:2028 (R;US)

Columbia Univ., New York, NY (United States)
Inverse Free Electron Laser beat-wave accelerator research: Annual progress report, 18:1295 (R;US)

Comision de Energia Atomica, La Habana (Cuba)
Applichation of the sulphate ceric dosimetric in the high doses range, 18:1401 (I;CU;In Spanish)
Obtention of thin depositions by the vacuum evaporation technique, 18:1190 (I;CU;In Spanish)
Preparation of high temperature superconductor ceramics using cuban reactives. Optimization of the synthesis method, 18:1036 (I;CU;In Spanish)

Commission of the European Communities, Brussels (Belgium). Directorate General for Energy
Glass furnace efficiency evaluation through three-dimensional modelling, 18:880 (IA;DE)

Commission of the European Communities, Luxembourg (Luxembourg)
A review of European compost standards, 18:924 (RA;FR)
A review of radionuclide release and transport in recent in-pile experiments, 18:458 (R;FR)
A simplified analysis of the effect of hydrogen generation following a beyond design basis accident in an Indian PHWR, 18:504 (RA;FR)
A strategy for hydrogen risks in WWER nuclear power plants, 18:479 (RA;FR)
A survey of nitrogen dioxide in Paris. July 1989 - January 1990, 18:1495 (R;FR)
Anaerobic digestion of source-sorted MSW, 18:907 (RA;FR)
Assessment of incineration of industrial wastes. Demonstration projects, 18:885 (R;FR)
Assessment study on organic fertilizers, 18:913 (RA;FR)
Biotechnology an Overview of Applications and Impact on Environment, 18:1667 (R;FR)
Calculation of the pressure transient due to hydrogen deflagration in closed and vented volumes, 18:503 (RA;FR)
Catalytic recombination systems for severe accidents and noised-induced ignition to detonation transition effect, 18:476 (RA;FR)
Catalytic removal of hydrogen in humid, hydrogen-air gas streams, 18:563 (RA;FR)
Chlorinated hydrocarbons and PCBs in field soils, sediments and sewage sludges, 18:132 (RA;FR)
Community documentation centre on industrial risk. Comparison of Liquefied Petroleum Gases (LPG) - related regulations, 18:147 (R;FR)
Comparisons of fathoms blind and open post-test predictions with the experimental data of HDR-H_2-mixing tests E.11.2 and E.11.4, 18:447 (RA;FR)
Compost standards without tears - some ideas from the UK, 18:923 (RA;FR)
Composting and compost quality assurance criteria, 18:886 (R;FR)
Composting control parameters and compost product characteristics, 18:911 (RA;FR)
Composting in Denmark, 18:925 (RA;FR)
Composting in Germany, 18:927 (RA;FR)
Composting in Greece, 18:926 (RA;FR)
Composting: status of research and commercial production in Ireland, 18:928 (RA;FR)
Composts market studies and supply demand analysis, 18:914 (RA;FR)
Concept and qualification of a combined system for hydrogen mitigation after severe accidents, 18:559 (RA;FR)
Conclusions of a study for the large scale melting of radioactive steel scrap arising from the dismantling of nuclear installations, 18:240 (RA;FR)
Criteria for transition to detonation for hydrogen flames, 18:452 (RA;FR)
Critical review on hydrogen mitigation by ignitors for large dry PWR containments, 18:475 (RA;FR)
Decommissioning operational experience in AEA technology, 18:440 (RA;FR)
Decontamination and dismantling of the PIVER prototype vitrification facility at Marcoule: final results and conclusions, 18:200 (RA;FR)
Deflagration tests of an air-hydrogen-steam mixture with not uniformly distributed steam, 18:557 (RA;FR)
Development of test methods for quality control of LLW and MLW in cement or polymers (Parts 1 and 2). Task 3. Characterization of radioactive waste forms. A series of final reports (1985-1989) no. 39, 18:236 (R;FR)
Dismantling of cells 22, 23 and 24 for the fabrication of caesium and strontium sources at CE Saclay ORIS pilot facility, 18:315 (RA;FR)
Dross and ultrafine particulate formation in underwater plasma-arc cutting, 18:233 (R;FR)
Dry anaerobic conversion of municipal solid waste by means of the Dranco process, 18:908 (RA;FR)
Effects of organic contaminants in sewage sludge on soil fertility, plants and animals, 18:131 (R;FR)
Electrochemical devices for hydrogen concentration and pH measurements in the coolant of water-cooled reactors, 18:455 (RA;FR)
Environmental radioactivity measurement. Ispra 1990, 18:1471 (R;FR;In Italian)
EPRI research on hydrogen combustion and control, 18:456 (RA;FR)
Estimation of the corrosion risk of solar collectors. A five-year weathering experiment in industrial and rural areas, 18:386 (R;FR)
European solar test installation (ESTI). Qualification test procedures for crystalline silicon photovoltaic modules, 18:369 (R;FR)
Experimental results and modelling strategies for multi-compartment hydrogen deflagration, 18:450 (RA;FR)
Experimental results of the large-scale HDR hydrogen-mixing experiments E11.2 and E11.4; 18:469 (RA;FR)
Feasibility testing of the incineration of contaminated graphite in a pilot fluidized bed, 18:241 (RA;FR)
Fissures and boreholes plugging in fractured geologic deposits (granites), 18:235 (R;FR;In French)
Flame acceleration in hydrogen/air/steam mixtures in the presence of repeated obstacles in a closed volume, 18:558 (RA;FR)
Geomechanical behaviour of boom clay under ambient and elevated temperature conditions, 18:237 (R;FR)
Guidelines for the technical follow-up of solar thermal plants, 18:390 (R;FR)
Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, 18:445 (R;FR)
Hydrogen behaviour in VVER - 440 nuclear power plants in case of severe accidents, 18:478 (RA;FR)
Hydrogen distribution experiments for Loviisa ice condenser containment, 18:470 (RA;FR)
Hydrogen generation during reflooding of degraded core as an accident management measure, 18:446 (RA;FR)
Hydrogen in water-cooled nuclear power reactors, 18:444 (R;FR)
Hydrogen mitigation technical means of nuclear power plants, 18:473 (RA;FR)
Hydrogen mitigation using catalyst modules, 18:561 (RA;FR)
Hydrogen production limits under PWR degraded core conditions: the status of current modelling capabilities and plant predictions, 18:468 (RA;FR)
Hydrogen risk: studies about detonation phenomena via Plexus code, 18:556 (RA;FR)
In-vessel composting system and test of compost products for professional greenhouse growers, 18:918 (RA;FR)
Iso solar thermal standards studies to improve technical and scientific information for the finalization of performance test procedures, 18:385 (R;FR)
Italian Ryegrass as a source of fermentable sugars and protein feedstuff, 18:329 (R;FR)

JET Joint Undertaking. Progress report 1991 - volume 1, 18:2364 (R;FR)
Jet Joint Undertaking. Progress report 1991 - volume 2, 18:2365 (R;FR)
Landfill gas from environment to energy, 18:330 (R;FR)
Low temperature preparation of physical solvents for the treatment of natural gas. Final report, 18:144 (R;FR;In French)
Marketing of standardized composts, 18:912 (RA;FR)
Mechano-chemical model of breakaway zirconium oxidation, 18:453 (RA;FR)
Melting of radioactive scrap. A.- Experience gained by SGR and Siemens with the melting of radioactive scrap. B.- First results obtained with the melting of alpha-contaminated steel scrap, 18:239 (RA;FR)
Microbial emissions from composts made for mushroom production and from domestic waste, 18:910 (RA;FR)
Mitigation of hydrogen threats to large dry containments (German approach), 18:474 (RA;FR)
Modelling of radionuclide migration and heat transport from an High-Level-Radioactive-Waste-repository (HLW) in Boom clay, 18:238 (R;FR)
New standards and compost quality in the Federal Republic of Germany: the standards, the organisation for control, acceptance in practice, 18:916 (RA;FR)
Numerical analysis and nuclear standard code application to thermal fatigue, 18:2363 (R;FR)
Objectives for the development of composting in France: a strategic approach, 18:901 (RA;FR)
Odour emissions from composting plants, 18:909 (RA;FR)
On-line analysis of cement raw materials by prompt gamma neutron activation analysis, 18:314 (RA;FR)
Organic chemicals in compost: how relevant are they for the use of it, 18:920 (RA;FR)
Parameters for sorting/composting of municipal solid wastes, 18:906 (RA;FR)
Photovoltaic demonstration projects, 18:375 (R;FR)
Pilot dismantling of the AT1 FBR reprocessing facility at La Hague. Phase 1 - Dismantling of dissolution and extraction systems and processing of the arising dismantling waste, 18:199 (RA;FR)
Pilot dismantling of the KRB A BWR at Gundremmingen. Phase 1 - Dismantling of contaminated and activated components, 18:459 (RA;FR)
Pilot dismantling of the Windscale advanced gas-cooled reactor - phase 1: dismantling of the refuelling stand pipes and RPV top dome, 18:491 (RA;FR)
Pilot tests on radioactive waste disposal in underground facilities, 18:234 (R;FR)
Practical decommissioning experience with nuclear installations in the European Community, 18:1209 (R;FR)
Proceedings wind energy R and D contractor meeting, 18:410 (R;FR)
Proving test on the reliability for reactor containment vessel (2) hydrogen burning test, 18:454 (RA;FR)
Proving test on the reliability for reactor containment vessel hydrogen mixing and distribution test, 18:471 (RA;FR)
Pyrolytic combustion installation of textiles wastes with energy recovery, 18:883 (R;FR;In French)
Quantitative analysis and automation of CaF_2 ore flotation via neutronic activation, 18:313 (RA;FR)
Recent decommissioning experience in BNFL, 18:1210 (RA;FR)
Reduction of energy consumption in the washing process of textile fabrics by advanced technology, 18:884 (R;FR)
Reference methods for analysis of composts, 18:915 (RA;FR)
Remote dismantling experience at Windscale pile chimneys and other AEA/BNFL facilities, 18:492 (RA;FR)
Removal of hydrogen with catalytic recombiners during severe accident situations, 18:562 (RA;FR)
Report on the first steps of the remote-controlled dismantling of the pressure-tube HWGCR of KKN at Niederaichbach, 18:505 (RA;FR)
Results of experimental work on composts and their quality in relation to plant growth and environmental standards, 18:919 (RA;FR)
Results of the PHDR computational Benchmark exercises on hydrogen distribution experiments E11.2 and E11.4, 18:449 (RA;FR)
Sodium fire aerosol behaviour: a review of studies carried out under the auspices of the CEC, 18:519 (R;FR)
Some aspects of hydrogen catalytic recombiner operation under severe accident conditions, 18:477 (RA;FR)
Summary of the dimensioning verification studies of the Phebus-FP experiments, 18:443 (R;FR)
Summary reports of the R and D programme: primary raw materials (1986-89) - Volume III, 18:2403 (R;FR)
Survey on biowaste activities in Denmark and the nordic countries, 18:902 (RA;FR)
The assessment of containment codes by experiments simulating severe accident scenarios, 18:457 (R;FR)
The BR3 pressurized water reactor pilot dismantling project. Chemical decontamination of the primary loop development and commissioning of equipment for the segmenting of the reactor internals, 18:480 (RA;FR)
The composting process applied to sewage sludge and source separated refuse, 18:904 (RA;FR)
The control of the composting process and quality of end products, 18:905 (RA;FR)
The Danish programme on joint biogas plants, 18:903 (RA;FR)
The persistence of polynuclear aromatic hydrocarbons in sewage sludge-amended agricultural soils, 18:133 (RA;FR)
The reaction between H_2 and O_2 over tungsten carbide catalysts, 18:560 (RA;FR)
The role of composting in an integrated waste management system, 18:900 (RA;FR)
The use of lithium-bearing geothermal fluids for the industrial production of lithium, 18:981 (RA;FR)
Three dimensional numerical simulation of hydrogen distribution and mixing in containment, 18:448 (RA;FR)
Transfer of inorganic pollution by composts, 18:921 (RA;FR)
Treatment and use of sewage sludge and liquid agricultural wastes. Review of COST 68/681 programme, 1972-90, 18:354 (R;FR)
Two models of hydrogen combustion in a closed cylinder, 18:451 (RA;FR)
United Kingdom waste management survey 1990-1991, 18:922 (RA;FR)
Use of mineralization kinetics to estimate the agricultural value of organic fertilizers, 18:917 (RA;FR)
Use of the Jericho code for the assessment of thermalhydraulics and hydrogen behaviour in nuclear power plant containment, 18:472 (RA;FR)

Ultrasonic testing X gammagraphy, 18:1263 (I;BR;In Portuguese)
Use of x-ray and fluoroscopy assays in the industry of armament and ammunition, 18:316 (I;BR;In Portuguese)

Instituto de Engenharia Nuclear (IEN), Rio de Janeiro, RJ (Brazil). Dept. de Reatores
A new library of cross sections generators codes adapted to fast neutron spectra calculation, 18:2454 (IA;BR;In Portuguese)
Access to the code AD21, 18:605 (IA;BR;In Portuguese)
Analysis and verification of CTS-1 IEN/CNEN sodium loop design stresses in normal and emergency conditions, 18:1004 (IA;BR;In Portuguese)
Analysis of pressure waves propagation in hydraulic circuits for thermal shock with sodium, 18:577 (IA;BR;In Portuguese)
Analytical model and complementary experiences for natural convection in the R.P.R. reactor, 18:694 (IA;BR;In Portuguese)
Assembly of a thermohydraulic-neutronic simulator-optimizer for the design of low power experimental fast reactor, 18:522 (IA;BR;In Portuguese)
Boundary conditions for natural convection analysis in the R.P.R. reactor pool, 18:701 (IA;BR;In Portuguese)
Calculation of CTS-1 thermal insulation, 18:571 (IA;BR;In Portuguese)
Calculation of drainage time for sodium loops, 18:567 (IA;BR;In Portuguese)
Calculation of minimum mass of plutonium required for experimental fast reactor construction, 18:523 (IA;BR;In Portuguese)
Calculation of the R.P.R. reactor control rods: current status and alternatives, 18:600 (IA;BR;In Portuguese)
Calculations of thermohydraulic limits of a plate type reactors in conditions of normal cooling and natural convection, 18:690 (IA;BR;In Portuguese)
Characteristics and composition of smokes in sodium fires, 18:528 (IA;BR;In Portuguese)
Compatibility study of magnesium oxide with sodium, 18:572 (IA;BR;In Portuguese)
Creep rupture behaviour of a cruciform specimen submitted to a triaxial tensile stress state, 18:1003 (IA;BR;In Portuguese)
Cross sections calculation by inelastic neutron transmission and scattering, 18:2061 (IA;BR;In Portuguese)
Definition of height and dimensions of stack of R.P.R. reactor building, 18:693 (IA;BR;In Portuguese)
Design and construction of a filling and drainage system for the water loop, 18:568 (IA;BR;In Portuguese)
Development and utilization of computer programs to the nuclear measures laboratory, 18:2456 (IA;BR;In Portuguese)
Development of computer program for solution of a mathematical model to thermohydraulics calculation in sodium loops, 18:1245 (IA;BR;In Portuguese)
Development of the computer code for transients analysis in experimental fast reactor, 18:534 (IA;BR;In Portuguese)
Development planning of a subcritical assembly in the Argonauta reactor, 18:685 (IA;BR;In Portuguese)
Elastoplastic adaptation applied to shell structure, 18:576 (IA;BR;In Portuguese)
Energy equation steady solution for calculation of natural convection in sodium loops, 18:542 (IA;BR;In Portuguese)
Execution of CP1 code at CNEN H-Bull computer, 18:2455 (IA;BR;In Portuguese)
Experimental evaluation of the TV-CTS-1 code for thermohydraulic parameters calculation of CTS-1 thermal sodium loop, 18:565 (IA;BR;In Portuguese)
Experimental evaluation of the TV-CTS-1 code, 18:1246 (IA;BR;In Portuguese)
Experimental results of drop of pressure and friction factor of preliminary tests in R.P.R. reactor fuel elements, 18:700 (IA;BR;In Portuguese)
Experiments to increase the thermal neutron flux in the R.P.R. reactor central channel, 18:675 (IA;BR;In Portuguese)
First experimental tests with the assembly for studies on seven rod bundles flow with fast reactors geometry, 18:530 (IA;BR;In Portuguese)
Flow rate calculation during the line drainage of the SS-50 sodium circuit confluent to the 05-M mixer, 18:1242 (IA;BR;In Portuguese)
Friction factor in seven rods bundle in fast reactors typical geometry, 18:533 (IA;BR;In Portuguese)
Heat dynamic in the primary circuit of the R.P.R. reactor, 18:691 (IA;BR;In Portuguese)
Heat removal by natural convection in a R.P.R. reactor, 18:697 (IA;BR;In Portuguese)
Hypothetical sodium accident analysis in the CTS-1 cooled thermal loop during the heat exchanger obstruction removal operation, 18:529 (IA;BR;In Portuguese)
Implantation and con validation of the computer program TERM for thermal analysis of axisymmetric bidimensional structures, 18:2460 (IA;BR;In Portuguese)
Incompressible viscous flows: a two-dimensional analysis, 18:1250 (IA;BR;In Portuguese)
Manual of SITIO computer code for calculation of local radiological dose, 18:695 (IA;BR;In Portuguese)

Manual of the computer program NUC2 for the thermohydraulic calculation of the research reactor primary coolant circuit, 18:696 (IA;BR;In Portuguese)
Measurement results of Argonauta reactor conversion factor, 18:678 (IA;BR;In Portuguese)
Method of supercell dilution, 18:604 (IA;BR;In Portuguese)
Modeling of the primary system of a pool type fast reactor, 18:526 (IA;BR)
Modelling of the primary coolant circuit of a EBR-II fast reactor. Part I: theory, 18:531 (IA;BR;In Portuguese)
Modification in the Hammer code to get cross sections by isotopes at 4 energy groups, 18:2457 (IA;BR;In Portuguese)
Modifications in TEACH-C computer code for convection-diffusion transients analysis in two dimensions, 18:1251 (IA;BR;In Portuguese)
Modified operator analysis on convection-diffusion problems, 18:1249 (IA;BR)
Neutronic analysis of the new fuel element without graphite as vertical reflector in the rods, 18:603 (IA;BR;In Portuguese)
Neutronic study of 5 MW R.P.R. reactor without central chamber, 18:680 (IA;BR;In Portuguese)
Neutronic study on influence of 8 plates of the Argonauta reactor fuel element with cermet height reduced from 60,20 cm to 52,51 cm, 18:687 (IA;BR;In Portuguese)
Nuclear reactor design and operation strategy computation, 18:599 (IA;BR)
On the job training on fast reactors components design, 18:525 (IA;BR;In Portuguese)
Operation and maintenance of neutron generator, 18:1286 (IA;BR;In Portuguese)
Operation and maintenance of the CTS-1 sodium loop, 18:569 (IA;BR;In Portuguese)
Operation and maintenance of the Argonauta reactor, 18:679 (IA;BR;In Portuguese)
Operation and maintenance of the CTS-1 sodium thermal loop, 18:1244 (IA;BR;In Portuguese)
Operation of the thermohydraulics measures laboratory, 18:1247 (IA;BR;In Portuguese)
Operation of thermohydraulic measures laboratory, 18:1243 (IA;BR;In Portuguese)
Optimization of the TV-CTS-1 calculation code, 18:2459 (IA;BR;In Portuguese)
Optimization study of the R.P.R. reactor with 4.3% enriched fuel, 18:683 (IA;BR;In Portuguese)
Ovalization and structural integrity of the zone 10 of the Angra-2 reactor pressure vessel. Part I: non-linear material analysis. Part II: non-linear material and geometric analysis, 18:481 (IA;BR;In Portuguese)
POS2D: a graphic program for analyzing axisymmetric and two-dimensional structures, 18:2461 (IA;BR;In Portuguese)
Preliminary investigation about the structural materials effects on reactivity and irradiation chamber thermal flux of the 5 MW, 4,3% enriched uranium R.P.R. reactor, 18:686 (IA;BR;In Portuguese)
Preliminary report about the R.P.R. reactor without central chamber, 18:676 (IA;BR;In Portuguese)
Preparation for assembling of the new sodium loops, 18:574 (IA;BR;In Portuguese)
Preparation of EBR-II reactor data for the SORES code. Part II: steady state, 18:699 (IA;BR;In Portuguese)
Presentation of a technique for measure of fast fission reactor, 18:2035 (IA;BR;In Portuguese)
Presentation of an experimental technique for measurement of the parameter P using uranium thin target made at CNEN/IEN Laboratories, 18:2034 (IA;BR;In Portuguese)
R.P.R. burnup calculation: first phase, 18:677 (IA;BR;In Portuguese)
Reactor kinetics modulus, 18:684 (IA;BR;In Portuguese)
Reduction of execution time of the program for the calculation of natural convection transients at CTS-1 sodium loop, 18:566 (IA;BR;In Portuguese)
Reliability study on calculation methods applied to the R.P.R. reactor, 18:682 (IA;BR;In Portuguese)
Results for R.P.R. reactor control rods (B_4C-AL), 18:602 (IA;BR;In Portuguese)
Safety instruction for CTS-1 sodium thermal circuit operation, 18:573 (IA;BR;In Portuguese)
Shielding calculation for fission products radiation levels in the R.P.R. reactor after the shutdown, 18:681 (IA;BR;In Portuguese)
Simplified analysis for transients in pool type liquid metal reactors, 18:692 (IA;BR;In Portuguese)
Sodium temperature evaluation during a cold thermal shock, 18:1248 (IA;BR;In Portuguese)
Spatial interpolation in tri dimensional neutronic simulation to experimental fast reactor with control bars, 18:606 (IA;BR;In Portuguese)
Spatial kinetics coupled to the simulator, 18:550 (IA;BR;In Portuguese)
Study on fast neutrons moderation in polyethylene and paraffin from a ^{241} Am-Be (α, n) source, 18:551 (IA;BR;In Portuguese)
Study on flow in wire wrap spaced hexagonal rod bundles, 18:524 (IA;BR;In Portuguese)
Study on In-Cd-Ag control bars positioning and efficacy in the R.P.R. reactor core, 18:601 (IA;BR;In Portuguese)
Study on techniques and methods for determination of reactor parameters in a subcritical unit, 18:688 (IA;BR;In Portuguese)
Test section for the determination of loss of pressure in the radioisotope production reactor fuel elements, 18:689 (IA;BR;In Portuguese)
Thermal deformation analysis in scale model of the CTS-1 sodium loop, 18:570 (IA;BR;In Portuguese)
Thermohydraulic preliminary design of a experimental fast reactor. Part I: medium fuel element, 18:532 (IA;BR;In Portuguese)
Triennial technical report - 1986, 1987, 1988 - Instituto de Engenharia Nuclear (IEN) -Dept. of Reactors (DERE), 18:2405 (I;BR;In Portuguese)
Utilization manual of the computer code 3D-AIRLOCA, 18:698 (IA;BR;In Portuguese)
Utilization manual of the computer program FLUIDO-2D, 18:1252 (IA;BR;In Portuguese)
Vacuum distiller for determining the presence of oxygen in sodium, 18:527 (IA;BR;In Portuguese)
Validation of WIMSTRACA code, 18:2458 (IA;BR;In Portuguese)
Verification of maximum stresses in the CTS-1 sodium loop heat exchangers during the solidified sodium removal operation, 18:1212 (IA;BR;In Portuguese)
Verification of the control quality documentation of the new sodium loops of IEN (Nuclear Engineering Institute), 18:575 (IA;BR;In Portuguese)

Johns Hopkins Univ., Baltimore, MD (United States). Dept. of Geography and Environmental Engineering
Reductive mobilization of oxide-bound metals: Progress report, September 15, 1991–September 15, 1992, 18:1631 (R;US)

Joint Inst. for Heavy Ion Research, Oak Ridge, TN (United States)
Rotational band structure of intruder configurations: success and limitations of the Cranked Shell Model, 18:1992 (R;US)

Joint Inst. for Nuclear Research, Dubna (Russian Federation)
A program-controlling distribution of high voltage in CAMAC standard, 18:1423 (R;SU;In Russian)
An autonomous microprocessor system for measurement of betatron oscillation parameters using signal processor, 18:1372 (R;SU;In Russian)
Precision monitor of bunched beam intensity, 18:1369 (R;SU;In Russian)
The production of two multicharged fragments in fragmentation of ^{28}Si on photoemulsion nuclei, 18:2044 (R;SU;In Russian)
The resistive instability damper system for the first stage of the UNK accelerator with IIR-filter in feedback, 18:1320 (R;SU;In Russian)

Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation
A REDUCE program for symbolic computation of Puiseux expansions, 18:2465 (R;SU)
Applicability of cascade-evaporation model to the calculation of radiation damages due to ions with energies T>1 GeV, 18:1006 (R;SU)
Applications of discrete transformations in the problem of preliminary data processing for experiments in high energy physics, 18:1425 (R;SU;In Russian)
Approximation formulae for functional integrals in $P(\Phi)_2$-quantum field theory, 18:1895 (R;SU)
Computer algebra tools for higher symmetry analysis of nonlinear evolution equations, 18:1894 (R;SU)
Dependence of electronuclear characteristics on ^{239}Pu and ^{235}U concentration, 18:588 (R;SU;In Russian)
Equation of motion of four degree for tetranions, 18:1807 (R;SU;In Russian)
Finite element method for simulation of the semiconductor devices, 18:1114 (R;SU;In Russian)
Heat generation produced in thin layers of GaAs superconductors under high energy particles irradiation, 18:2186 (R;SU;In Russian)
Investigation of the increased accuracy order difference schemes for the scattering problem at the quasi-uniform mesh, 18:2467 (R;SU;In Russian)
Investigation of tungsten and lead structural materials activation by 1.0-1.1 GeV protons, 18:1005 (R;SU)
Mathematical simulation of the induced γ-radiation in structural materials of spaceships. Time dependence, 18:1007 (R;SU;In Russian)
On a calculation of complex energies of the resonance states, 18:2003 (R;SU;In Russian)
Operator ordering and symbol representations of enveloping algebras, 18:1893 (R;SU)
The mathematical modelling of radiation damages of HTSC bolometers, 18:1449 (R;SU;In Russian)
Track reconstruction in discrete detectors, 18:1420 (R;SU)

Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy
A method for particle tracking through nonlinear fields in synchrotrons, 18:1318 (R;SU;In Russian)
Cast polystyrene plastic scintillator for the hadron calorimeter of the tagged neutrino beam facility, 18:1416 (R;SU;In Russian)
Comparative characteristics of polystyrene strips with different scintillation fraction, 18:1417 (R;SU;In Russian)
Infrared radiation absorption in superconducting metaloxide $YBa_2Cu_3O_{7-\sigma}$, 18:2225 (R;SU;In Russian)
MIMI - microtron source of multicharged ions, 18:1371 (R;SU;In Russian)
Modern approach to relativity theory (radar formulation), 18:1798 (R;SU)
Number detector coding device for investigations on pulsed reactors by the time-of-flight method, 18:1424 (R;SU;In Russian)
Parallel encoders for pixel detectors, 18:1419 (R;SU)
Study of relativistic hypernuclei produced in nucleus-nucleus interactions, 18:2001 (R;SU)
The device switching on spark gaps at the SLON setup, 18:1421 (R;SU;In Russian)
The study of reactions with deuteron and pions in the final state by np- and dp-interactions comparison, 18:2040 (R;SU)
Total breakup of ^{3}He and ^{4}He nuclei in interactions with protons, 18:2043 (R;SU;In Russian)

Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics
A new polarized neutrons method for studying depth-inhomogeneously magnetized magnetic films, 18:2158 (R;SU)
A possibility to investigate the superconducting gap with the help of neutrons, 18:2224 (R;SU;In Russian)
Energy spectra and photoelectron work function from $YBa_2Cu_3O_7$ high-T_c superconductor, 18:2187 (R;SU;In Russian)
Intense two-step cascades of ^{158}Cd compound-state decay, 18:2021 (R;SU)
Pattern recognition application for surveillance of abnormal conditions in a nuclear reactor, 18:702 (R;SU)
Slow neutron scattering on ThO_2 and UO_2, 18:2160 (R;SU;In Russian)
Study of the modulated structure of $Bi_2(Sr,Ca)_3Cu_2O_{8+\gamma}$ in the range 8-920 K, 18:2223 (R;SU)

Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems
A stand for measuring the magnetic field of the isochronous cyclotron, 18:1319 (R;SU;In Russian)
About possibility of standing the production region dimensions of fast protons, 18:2046 (R;SU;In Russian)
Alpha-particle backscattering from an iron plate surface ($0.5 MeV < E_\alpha < C_{barrier}$), 18:2188 (R;SU;In Russian)
ANS - the analysis of the neutron spectra, 18:2466 (R;SU)
Combined deflector for isochronous cyclotron U-120K, 18:1370 (R;SU;In Russian)
Cyclotron ion source with cold hollow cathode, 18:1368 (R;SU;In Russian)
Effects of atomic hydrogen on polymeric track detectors, 18:1450 (R;SU;In Russian)
Electronic equipment for selection of events in experiments on muon-catalyzed nuclear fusion reactions, 18:1427 (R;SU;In Russian)
Form factors of transition of hydrogen-like atoms between discrete and continuous spectrum states, 18:2072 (R;SU;In Russian)
Investigation of Y-Ba-Cu-O films using backscattering of $^{4}He^{+}$ ions, 18:2161 (R;SU;In Russian)
Measurement of magnetic field penetration depth in niobium polycrystalline films by polarized neutron reflection method, 18:2222 (R;SU)
Neutron Fourier diffractometer at the IBR-2 reactor, 18:1422 (R;SU;In Russian)
Proton tomograph for the proton therapy facility, 18:1418 (R;SU;In Russian)
Quantum-kinetic Green function and macroscopic wave function, 18:1810 (R;SU;In Russian)
Shell structure calculation method in eikonal theory, 18:2002 (R;SU;In Russian)
Spin-neutrino angular correlation in nuclear capture of polarized muons, 18:2047 (R;SU;In Russian)
Stabilized power supply unit for the correcting windings of the iron-current channel at the JINR phasotron, 18:1373 (R;SU;In Russian)
Standard model without Higgs particles, 18:1917 (R;SU)
The demagnetizing factors for the rectangular samples, 18:2159 (R;SU)
The device for coding the position in position sensitive detectors on the basis of the flash ADC, 18:1426 (R;SU;In Russian)
The measurement of the differential cross section in the double quasi-elastic proton scattering on ^{12}C at the energy of (660+-7) MeV, 18:2045 (R;SU;In Russian)
The ring electromagnetic model of the charged lepton, 18:1919 (R;SU;In Russian)

Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions

Damage produced by swift heavy ions in monocrystalline tungsten, 18:2189 (R;SU;In Russian)
Investigation of β-delayed neutron emission and elastic scattering of neutron-rich isotopes of He and Li, 18:1949 (R;SU)
On the impossibility of creating the quantum correlations with computer, 18:1805 (R;SU)
Program SITHA. New version of the multigroup system of the neutron cross section GR175-V1, 18:2062 (R;SU;In Russian)
Studies of formation of fusion evaporation residues with $Z \geq 83$ in heavy ion reactions, 18:2042 (R;SU)
The multichannel serial-parallel measurement system for slow-changing signals, 18:1374 (R;SU;In Russian)

Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics

A covariant form of the Maxwell's equations in four-dimensional spaces with an arbitrary signature, 18:1891 (R;SU)
A dynamical model of structural phase transition in La_2CuO_4, 18:1066 (R;SU)
A new view on the machinery of generation of spectral zones: The discrete and the ordinary quantum mechanics, 18:1809 (R;SU;In Russian)
Application of the unitary representations of the Lorentz group for the description of interaction of a fermion with a scalar particle, 18:1892 (R;SU)
Beyond two dimensions, 18:1886 (R;SU)
Character of phase transition in two- and three-dimensional scalar $g\phi^4$ theory, 18:1889 (R;SU)
Classical mechanics of confined particles, 18:1803 (R;SU)
Coupled-channel analysis of low energy nucleon-antinucleon interactions, 18:1944 (R;SU)
Determination of the strange quarks's contribution to the proton spin in semi-inclusive deep inelastic electroproduction of K and π mesons, 18:1947 (R;SU)
Elements of the theory of resonance management of the quantum scattering: Simple models clarifying the general case, 18:1808 (R;SU;In Russian)
Geometrical approach to the dynamics of a relativistic string in the D-dimensional Minkowski space, 18:1884 (R;SU)
Higgs-Higgs interaction up to higher orders of perturbation theory in the standard model 1: Self-energy and vertex diagrams, 18:1913 (R;SU)
Higgs-Higgs interaction up to higher orders of perturbation theory in the standard model 2: Box diagrams and one-loop amplitude, 18:1914 (R;SU)
Integrals of motion on the group of invariance of an interval in three-dimensional spaces, 18:1896 (R;SU;In Russian)
Low-energy predictions of SUSY GUTs: minimal versus finite model, 18:1916 (R;SU)
Naive model of electromagnetic structure of octet baryons, 18:1945 (R;SU)
Nonlinear realizations of W_3 symmetry, 18:1888 (R;SU)
Numerical investigation of Tonomura experiments, 18:1801 (R;SU)
Off-shell form factors in the soft photon limit for pion photoproduction, 18:2041 (R;SU)
On the method of determining relations, 18:1806 (R;SU;In Russian)
On the subtleties of the spectrum of light meson resonances 1: The model, 18:1942 (R;SU)
On the subtleties of the spectrum of light meson resonances 2: II. Data analysis, 18:1943 (R;SU)
On two-dimensional quasiclassics, 18:1800 (R;SU)
Phase space representations for spin 2, 18:1802 (R;SU)
Phase structure of three- and four-dimensional ϕ^4 field theory, 18:1890 (R;SU)
Quantum mechanics of toroidal anions, 18:1799 (R;SU)
Quantum states of the photon phase operator, 18:1804 (R;SU)
Quasipotential of two-particle system and the infrared singularities, 18:2071 (R;SU;In Russian)
Role of mixed state in statistical models of deconfinement, 18:1918 (R;SU;In Russian)
Semileptonic decays of D- and B-mesons in the relativistic quark model, 18:1946 (R;SU)
Spin-dependent structure functions of sea quarks in the framework of nonperturbative QCD and new Regge trajectory, 18:1915 (R;SU)
Status of CP violation in K decays within chiral perturbation theory, 18:1885 (R;SU)
Superfield actions for N=4 WZNW-Liouville systems, 18:1887 (R;SU)
The yield of resonances in the He(e, 2e)He^+ reaction depending on the ejection angle, 18:2083 (R;SU;In Russian)
Towards the results of global analysis of data on nucleon electromagnetic structure, 18:1948 (R;SU)

Princeton Univ., NJ (United States). Dept. of Mechanical and Aerospace Engineering
Investigation of essential elements of stratified-charge combustion: Final technical report, October 1, 1985–December 31, 1989, 18:940 (R;US)

Princeton Univ., NJ (United States). Plasma Physics Lab.
Neutron emission from TFTR supershots, 18:2344 (R;US)
Princeton University Plasma Physics Laboratory, Theory Division quarterly report, January 1–March 31, 1992, 18:2347 (R;US)
Quenching A-coefficients by photons in a short discharge tube, 18:2346 (R;US)
Summary of the third workshop on alpha particle physics in TFTR, 18:2345 (R;US)

PSI Technology Co., Andover, MA (United States)
Transformations of inorganic coal constituents in combustion systems: Quarterly report No. 22, January 1–March 31, 1992, 18:61 (R;US)

Purdue Univ., Lafayette, IN (United States)
Materials research and beam line operation utilizing NSLS: Progress report, 18:1355 (R;US)

Purdue Univ., Lafayette, IN (United States). Dept. of Chemistry
Deexcitation processes in nuclear reactions: Annual progress report, 18:2030 (R;US)

Purdue Univ., Lafayette, IN (United States). Thermalhydraulics and Reactor Safety Lab.
Hydrodynamically induced dryout and post dryout important to heavy water reactors: A yearly progress report, 18:501 (R;US)

R

RE/SPEC, Inc., Rapid City, SD (United States)
Consolidation of the Waste Isolation Pilot Plant crushed salt/bentonite mixtures as a function of confining pressure and moisture content as compared with constitutive model predictions, 18:262 (R;US)
Waste Isolation Pilot Plant: Alcove Gas Barrier trade-off study, 18:263 (R;US)

Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering and Engineering Physics
Development of an electrical impedance computed tomographic two-phase flows analyzer: Progress report for the period 1 October 1990–31 May 1992, 18:1235 (R;US)

Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States)
US Department of Energy Nevada Field Office annual site environmental report, 1991: Volume 1, 18:1489 (R;US)
US Department of Energy Nevada Field Office annual site environmental report, 1991: Volume 2, Appendices, 18:1490 (R;US)

Rhode Island Hospital, Providence, RI (United States)
An improved method for producing radiation hybrids applied to human chromosome 19: Technical progress report, 18:1735 (R;US)

Rhode Island Univ., Kingston, RI (United States)
Surface physics with cold and thermal neutron reflectometry: Progress report, April 1, 1991–March 31, 1992, 18:2101 (R;US)

Rockwell International Corp., Thousand Oaks, CA (United States). Science Center
Mechanisms of mechanical fatigue in ceramics: Annual technical progress report No. 2, August 15, 1990–August 14, 1991, 18:1039 (R;US)

Rogalandsforskning, Stavanger (Norway)
Using foam to reduce sand production, 18:126 (R;NO)

Rutherford Appleton Lab., Chilton (United Kingdom)
A novel scenario for neutrino masses in superstring-inspired GUT models, 18:1923 (R;GB)
Analysing $\gamma\gamma \rightarrow \pi\pi$ and what it can tell us, 18:1955 (R;GB)
Effective heavy quark theory, 18:1981 (R;GB)
New information on parton distributions, 18:1954 (R;GB)
Profile analysis of neutron powder diffraction data at ISIS, 18:1436 (R;GB)
Reexamining the fermion mass relations in the supersymmetric SU(4)xO(4) GUT model, 18:1922 (R;GB)
The high resolution powder diffractometer (HRPD) at ISIS - a user guide, 18:1435 (R;GB)

S

S-Cal Research Corp., San Rafael, CA (United States)
System to inject steam and produce oil from the same wellbore through downhole valve switching: First quarterly report, 18:103 (R;US)

Sandia National Labs., Albuquerque, NM (United States)
Advanced direct liquefaction concepts for PETC generic units: Quarterly technical progress report, April 1992–June 1992, 18:33 (R;US)
Advanced handling concepts and application to storage and transport systems, 18:300 (R;US)
An improved spectral graph partitioning algorithm for mapping parallel computations, 18:2478 (R;US)
An overview of current activities at the National Solar Thermal Test Facility, 18:378 (R;US)
Application of grazing incidence x-ray diffraction to polymer blends, 18:1120 (R;US)
Application of RADTRAN to estimation of doses to persons in enclosed spaces, 18:1760 (R;US)
Burnup credit issues in transportation and storage, 18:1225 (R;US)
Comparison of 10 CFR 71 normal conditions with bounding US "hot day" extremes, 18:1222 (R;US)
Consolidation of the Waste Isolation Pilot Plant crushed salt/bentonite mixtures as a function of confining pressure and moisture content as compared with constitutive model predictions, 18:262 (R;US)
Description and validation of ERAD: An atmospheric dispersion model for high explosive detonations, 18:1503 (R;US)
Design and development of an IBM/VM menu system, 18:2481 (R;US)
Development of a commercial photovoltaic concentrator module, 18:387 (R;US)
Diagnostic behavior of the Wire Arc Plasma spray process, 18:1227 (R;US)
Dielectric optical waveguide sensors integrated with GaAs active devices, 18:1458 (R;US)
Effect of oxide thickness on interface-trap buildup rates, 18:1281 (R;US)
Energy distribution of trapped holes in irradiated SiO_2, 18:1078 (R;US)
Experimental results from pressure testing a 1:6-scale nuclear power plant containment, 18:583 (R;US)
Fine-particle iron catalysts: Testing program at Sandia National Laboratories, 18:52 (R;US)
Generation of aerosolized particulate contamination by the wear of stainless steels, 18:1021 (R;US)
Handling effluent from nuclear thermal propulsion system ground tests, 18:539 (R;US)
High efficiency UHF oscillator for portable battery-powered applications, 18:1279 (R;US)
Integrated test and package methods for integrated photonics, 18:1277 (R;US)

Intermodal transfer of spent fuel, 18:1223 (R;US)
LLUVIA-II: A program for two-dimensional, transient flow through partially saturated porous media: Yucca Mountain Site Characterization Project, 18:261 (R;US)
Loss of essential service water in LWRs (GI-153): Scoping study, 18:721 (R;US)
Modeling of the vacuum plasma spray process, 18:1020 (R;US)
Overview of waste component recycle, treatment, and disposal integrated demonstration (WeDID) activities, 18:264 (R;US)
Phenomenological direct containment heating models in CONTAIN and their assessment against experimental data, 18:726 (R;US)
Photoconductive semiconductor switches for high power radiation, 18:1278 (R;US)
Pulsed holography for hypervelocity impact diagnostics, 18:1457 (R;US)
Radiation hardened nonvolatile memory for space and strategic applications, 18:1452 (R;US)
Results for the pyroshock ground test series for the STARS I and STARS II missile systems, 18:1470 (R;US)
Results of an experiment in a Zion-like geometry to investigate the effect of water on the containment basement floor on direct containment heating (DCH) in the Surtsey Test Facility: The IET-4 test, 18:725 (R;US)
Results of the Sandia National Laboratories MOSAIK cask drop test program, 18:1224 (R;US)
Revised nomenclature for defects at or near the Si/SiO_2 interface, 18:1280 (R;US)
SAFSIM input manual: A computer program for the engineering simulation of flow systems, 18:1258 (R;US)
STACE: Source Term Analyses for Containment Evaluations of transport casks, 18:1228 (R;US)
Strained quantum well modulation-doped InGaSb/AlGaSb structures grown by molecular beam epitaxy, 18:1119 (R;US)
System model development for nuclear thermal propulsion, 18:538 (R;US)
Technique for current step measurements on the low field Metal Oxide Varistor (MOV), 18:1466 (R;US)
The detection of organophosphonates by polymer films on a surface acoustic wave device and a micromirror fiber optic sensor, 18:950 (R;US)
The development of an on-site container, 18:1463 (R;US)
The performance of PAGOSA on several SIMD and MIMD parallel computers, 18:2477 (R;US)
The Sandia Airborne Computer (SANDAC), 18:2476 (R;US)
The use of the charge-induced voltage alteration technique to analyze precursors to dielectric breakdown, 18:1276 (R;US)
Thermal coating development for impulse drying, 18:895 (R;US)
Thermal diffusion processes in aqueous sodium chloride solutions, 18:265 (R;US)
Transportation package design using numerical optimization, 18:1226 (R;US)
UNICOS® security system, 18:2479 (R;US)
UniTree, a mass storage solution at Sandia National Laboratories, 18:2480 (R;US)
Verification of the computer programs SLAAP and DATA, 18:2475 (R;US)
Waste Isolation Pilot Plant: Alcove Gas Barrier trade-off study, 18:263 (R;US)
Wind load design methods for ground-based heliostats and parabolic dish collectors, 18:388 (R;US)

Sandia National Labs., Livermore, CA (United States)
A theoretical study of the thermochemistry of molecules in the Si-C-Cl-H system, 18:1175 (R;US)

Science Applications International Corp., McLean, VA (United States)
Prospects for nuclear proliferation rollback: Seminar report, 18:948 (R;US)

Science Applications International Corp., Oak Ridge, TN (United States)
Remedial Investigation work plan for Bear Creek Valley Operable Unit 2 (Rust Spoil Area, SY-200 Yard, Spoil Area 1) at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee, 18:296 (R;US)

Scottish Nuclear Ltd., Glasgow (United Kingdom)
Annual report and accounts 1991/92, 18:439 (I;GB)

Secretariat d'Etat a la Recherche, Algiers (Algeria)
Coulometric determination of uranium using platinum and mercury electrodes, 18:1144 (R;DZ;In French)

Service Central de Protection contre les Rayonnements Ionisants, 78 - Le Vesinet (France)
Monthly results of measurements; Jun 1992, 18:1591 (R;FR;In French)
Monthly results of measurements; March 1992, 18:1588 (R;FR;In French)
Monthly results of measurements; April 1992, 18:1589 (R;FR;In French)
Monthly results of measurements; May 1992, 18:1590 (R;FR;In French)

Shell Research Ltd., Chester (United Kingdom). Thornton Research Centre
Development and validation of atmospheric dispersion models for ideal gases and hydrogen fluoride: Part 1, Technical reference manual, 18:1492 (R;US)

Electron emission by ion project-surface interaction, 18:2183 (IA;BR;In Portuguese)
Electron resonant magneto-tunneling in quantum points, 18:2293 (IA;BR;In Portuguese)
Electronic states in Ge/Si superlattices studied by electroreflectance, 18:2248 (IA;BR;In Portuguese)
Electronic structure and optical spectra of $YBa_2Cu_{3-x}M_xO_{7-\delta}$ superconductor, 18:2265 (IA;BR;In Portuguese)
Electronic structure of $(GaP)_n(InP)_n$ and $(GaAs)_n(InAs)_n$ superlattices with ≤ 7, 18:2289 (IA;BR)
Electronic structure of $A(B_{(1-x)}B'_{(x)})_2$ systems, 18:2231 (IA;BR;In Portuguese)
Electronic structure of polyacetylene with bonded oxygen, 18:1100 (IA;BR)
Energy shift in gold-palladium alloys investigated by XPS and XAES, 18:991 (IA;BR;In Portuguese)
Epitaxy growth of high quality GaInP/GaAs heterostructures, 18:2135 (IA;BR;In Portuguese)
EPRB correlation for light polarization, 18:1793 (IA;BR)
Equivalent chain model for albumin in pH7, 18:2115 (IA;BR;In Portuguese)
ESR in monocrystalline $AlCl_3$ with Mn^{2+} and Cu^{3+} impurities, 18:2117 (IA;BR;In Portuguese)
ESR of calcined tissue apatites, 18:2119 (IA;BR;In Portuguese)
ESR of $Zn(L\text{-}Leucine)_2$ crystals with $^{63}Cu(II)$ impurities, 18:2123 (IA;BR;In Spanish)
Exchange collapse of the EPR lines in a 2-dimensional paramagnet, 18:2125 (IA;BR)
Exciton binding energy in ultra thin InGaAs/InP single quantum wells, 18:2285 (IA;BR)
Excitonic optical transitions in strained heterostructures, 18:2271 (IA;BR)
Experiments for studying electronic transitions between confined states in GaAs with δ-doping by means of resonant Raman scattering, 18:2282 (IA;BR;In Portuguese)
Fast convergent free energy expansion for uniaxial superconductors in the London approximation, 18:2207 (IA;BR)
Formation of silicides on Cu(100)/Si(100), Cu/Si(111), Cu/a-Si and Cu/a-Si:H interfaces analysed by x-ray diffraction, 18:2153 (IA;BR;In Portuguese)
Formation of spatial charge and modification of composition in glasses submitted to external DDP, 18:1105 (IA;BR;In Portuguese)
Formation of the initial layer of iron nitrides in post-discharge nitridation by CEMS and CXMS, 18:2095 (IA;BR;In Portuguese)
Formation of the initial layer of iron nitrides in ion nitridation by CEMS and CXMS, 18:2096 (IA;BR;In Portuguese)
Franz-Keldysh oscillation associated to exciton in GaAs, 18:2292 (IA;BR;In Portuguese)
GaAs-(Ga,Al)As quantum wires: a study on photoluminescence spectrum related to plain receiver impurities, 18:2250 (IA;BR;In Portuguese)
Grain measurements in erbium doped fiber, 18:1273 (IA;BR)
High resolution spectroscopy of $^{13}CD_3OH$: generation of new laser lines, frequency measurements and identification of new transitions, 18:2066 (IA;BR;In Portuguese)
Hydrogenated germanium and silicon amorphous alloys ($a\text{-}Si_{1-x}Ge_x$:H), 18:1000 (IA;BR;In Portuguese)
Hysteretic losses in NbTi superconducting wires, 18:2267 (IA;BR;In Portuguese)
Images by nuclear quadrupole resonance, 18:2122 (IA;BR;In Spanish)
Impedance spectroscopy and optical modulation of Schottky barrier type devices and silicon MOS, 18:2284 (IA;BR;In Portuguese)
Impurity states in surfaces and metallic films, 18:2235 (IA;BR;In Portuguese)
Impurity-related optical absorption and photoluminescence spectra of $GaAs\text{-}Ga_{1-x}Al_xAs$ cylindrical quantum-well wires, 18:2281 (IA;BR)
Influence of deposition conditions on Si:H-a films obtained by cathodic pulverization, 18:1107 (IA;BR;In Portuguese)
Influence of deposition parameters of Fe thin films of Si <100> and Si <111> in Fe-Si reaction, 18:2133 (IA;BR;In Portuguese)
Influence of Fe^{56} on epitaxy recrystallization of Si in substrates <100> and <111>, 18:2175 (IA;BR;In Portuguese)
Influence of interfacial surface of Si <100>, <111> and amorphous on reaction of Fe and Si thin films, 18:2139 (IA;BR;In Portuguese)
Influence of microstructure on irreversibility curve of $YBa_2Cu_3O_{7-\delta}$, 18:2262 (IA;BR;In Portuguese)
Influence of oxygen concentration on irreversibility curve of Bi (2122) monocrystals, 18:2264 (IA;BR;In Portuguese)
Installation and initial activities of Magnetic Resonance Laboratory, 18:1211 (IA;BR;In Portuguese)
Interband transport in InAs/AlSb/GaSb heterostructures, 18:2290 (IA;BR;In Portuguese)
Intercalation of electrochromic thin films of transition metal oxides, 18:1055 (IA;BR;In Portuguese)
Interpretation of variation with the temperature and the magnetic field of Cr^{3+} fluorescence mean-life in $GdAlO_3$, 18:997 (IA;BR;In Portuguese)
Intra and inter-sub-band transitions in quantum wires, 18:2301 (IA;BR;In Portuguese)
Ion implantation in $Na\beta''$-alumina, 18:2180 (IA;BR;In Portuguese)

Phase transformations of odontologic alloy of the Cu-Zn-Al-Ni system, 18:2113 (IA;BR;In Portuguese)
Photoelectrochemical characterization of cadmium sulfide films, 18:1165 (IA;BR;In Portuguese)
Photoluminescence in asymmetrically doped quantum wells, 18:2298 (IA;BR;In Portuguese)
Photoluminescence of a-Ge:H, 18:2272 (IA;BR;In Portuguese)
Photoluminescence of the $Ga_{1-x}Al_xAs$:si confining layer of doped asymmetrically quantum wells (SAQW) growth by MBE, 18:2276 (IA;BR;In Portuguese)
Physico-chemical processes induced by ionizing radiation and dynamics of defects in MOS structures, 18:2173 (IA;BR;In Portuguese)
Plasma parameters produced by DC thermoionic discharge with magnetic confinement, 18:2333 (IA;BR;In Portuguese)
Polarizability of one-dimensional chains, 18:2246 (IA;BR;In Portuguese)
Potentiometric analysis for determining copper charge and oxygen content in Cu base oxides, 18:1050 (IA;BR;In Portuguese)
Preparation of Fe/Cr alloys by mechanical milling method: structural and magnetic characterization, 18:2109 (IA;BR;In Portuguese)
Pressure and composition effects on gap properties of $Al_xGa_{a-x}As$, 18:2273 (IA;BR;In Portuguese)
Pressure study of the electrical resistivity of high T_c superconductors, 18:1058 (IA;BR)
Proceedings of the 14. National Meeting on Condensed Matter Physics. v.2, 18:2093 (I;BR;In Portuguese)
Production of monoenergetic atomic beams using radiation pressure, 18:1814 (IA;BR;In Portuguese)
Production, chemical, morphological and structural characterization of titanium nitride thin films, 18:2146 (IA;BR;In Portuguese)
Protection for crucibles of evaporation by electron gun, 18:1046 (IA;BR;In Portuguese)
Proton nuclear magnetic resonance in $Ni_{36}Zr_{32}Hf_{32}H_{1.36}$, $Ni_{36}Zr_{32}Hf_{33}H_{1.20}$ and $Ni_{36}Zr_{64}H_{0.50}$ metallic glasses, 18:2127 (IA;BR;In Portuguese)
Prototype of superconducting magnet for magnetohydrodynamic energy generator, 18:2204 (IA;BR;In Portuguese)
Purification of gallium by physico-chemical processes, 18:2138 (IA;BR;In Portuguese)
Quantitative determination of phases by x-ray diffraction, 18:1048 (IA;BR;In Portuguese)
Reduction of quantum noise in a micromaser of two resonant non-degenerated photons, 18:1274 (IA;BR;In Portuguese)
Relaxation of Fermi level on interface formation, 18:2268 (IA;BR;In Portuguese)
Resistive transition in deoxygenated YBaCuO, 18:1057 (IA;BR;In Portuguese)
Resistivity and specific heat in YBaCuO-Ag samples, 18:1061 (IA;BR;In Portuguese)
Results of photomodulated spectroscopy in superlattices and quantum wells of $In_xGa_{1-x}As/GaAs$, 18:2256 (IA;BR;In Portuguese)
Self-consistent calculation in direct space of charge transfer distribution in a-Zr, 18:2064 (IA;BR;In Portuguese)
Shielding of electron-phonon interaction in polar semiconductors, 18:2279 (IA;BR;In Portuguese)
Simulation of magnetic resonance spectra, 18:2453 (IA;BR;In Portuguese)
Sintering of tungsten carbide using iron as binders, 18:1045 (IA;BR;In Portuguese)
Specific heat of Anderson, 18:2236 (IA;BR;In Portuguese)
Specific heat of $YBa_2Cu_3O_{7-x}$ at low temperatures, 18:1056 (IA;BR;In Portuguese)
Spin diffusion and spin-lattice relaxation of ^1H in polymer in the presence of small metallic aggregation, 18:2121 (IA;BR;In Portuguese)
Spin states of first conduction sub-band of a semi-conducting heterostructure, 18:2283 (IA;BR;In Portuguese)
Stacking fault energy of Fe-20Cr-10Ni and Fe-18Cr-16Ni, 18:2105 (IA;BR;In Portuguese)
States of Yb impurities in semiconducting III-V crystals, 18:2257 (IA;BR;In Portuguese)
Static electric conductivity in periodic Anderson model, 18:2237 (IA;BR;In Portuguese)
Structural model for vitreous boron trioxide in hyperbolic space, 18:2288 (IA;BR;In Portuguese)
Structural stability principia, 18:2233 (IA;BR;In Portuguese)
Studies on dielectric properties of anodic films in metallic valves, 18:998 (IA;BR;In Portuguese)
Studies on sintering and characterization of $Y_2Cu_2O_5$ and $BaCuO_2$ type ceramics, 18:1047 (IA;BR;In Portuguese)
Studies on the plane square complex of copper(II)-three-phenylarsenic oxide, in the Q band by ESR, 18:2126 (IA;BR;In Portuguese)
Study on calcination of ammonium paratungstate, 18:1161 (IA;BR;In Portuguese)
Study on characterization, compacting and sintering of aluminia aimimg to translucency properties, 18:2103 (IA;BR;In Portuguese)
Study on Cu(II) ion chains in Cu(L-glutamine) by ESR, 18:2131 (IA;BR;In Portuguese)
Study on desorption using time-of-flight technique, 18:2184 (IA;BR;In Portuguese)
Study on diffusion of Xe implanted in polymer film at low temperature, 18:2172 (IA;BR;In Portuguese)

Study on electrical characteristics of Nb/Nb_2O_5 (anodic growth)/Nb junctions, 18:1166 (IA;BR;In Portuguese)
Study on electronic structure of superconductors at high temperature by x-ray absorption spectroscopy (XAS), 18:2143 (IA;BR;In Portuguese)
Study on electronic structure of silicon using large unit cell approximation, 18:2254 (IA;BR;In Portuguese)
Study on formation kinetic of isostructural Bi-Sr-Co-O compounds to Bi-Sr-Ca-Cu-O high T_c superconductors, 18:2214 (IA;BR;In Portuguese)
Study on indirect interaction between adsorbed atoms, 18:2069 (IA;BR;In Portuguese)
Study on line shape of conduction electron paramagnetic resonance and localized magnetic impurities, 18:2118 (IA;BR;In Portuguese)
Study on magnetic behaviour in Fe/Nd multilayers, 18:2182 (IA;BR;In Portuguese)
Study on magnetic hyperfine interactions in Co_2YZ type Heusler alloys (Y = Ti, V and Z = Ge,Si,Sn), 18:988 (IA;BR;In Portuguese)
Study on mechanical properties of $Y_2Cu_2O_5$ and $BaCuO_2$ type sintered materials, 18:990 (IA;BR;In Portuguese)
Study on non occupied orbits of phthalocyanines by IPES and NEXAFS techniques, 18:2157 (IA;BR;In Portuguese)
Study on phase diagram of $YO_{1.5}$-CuO_x binary, 18:987 (IA;BR;In Portuguese)
Study on polymer ion conductors by NMR, 18:1163 (IA;BR;In Portuguese)
Study on thermal behaviour of poly(chloro sulfonate ethylene), 18:1103 (IA;BR;In Portuguese)
Study on transport properties in latex doped with iodine, 18:1101 (IA;BR;In Portuguese)
Study to obtain monoenergetic beam by numerical simulation nondegenerated photons, 18:1815 (IA;BR;In Portuguese)
Superconducting properties of $Ba_{1-x}K_xBiO_3$, 18:1059 (IA;BR;In Portuguese)
Superconductivity and antiferromagnetism in extended Hubbard model, 18:2208 (IA;BR;In Portuguese)
Superconductivity and spin-polaron pair model, 18:2211 (IA;BR;In Portuguese)
Superconductivity in two-band systems: application to transition metals and high-T_c materials, 18:2212 (IA;BR)
Superficial passivation of silicon-lithium type semiconductor detector, 18:1408 (IA;BR;In Portuguese)
Superficial polaritons in magnetic wires, 18:2241 (IA;BR;In Portuguese)
Superlattices submitted to electric and magnetic fields, 18:2291 (IA;BR;In Portuguese)
Susceptibility and AC resistivity of Cr-V alloys bombardment, 18:994 (IA;BR;In Portuguese)
Synthesis and characterization of $Y_1Ba_2Cu_3O_{7-x}$ using national raw materials, 18:1052 (IA;BR;In Portuguese)
Synthesis of GaAs by SSD (Synthesis, Solute Diffusion) technique, 18:2102 (IA;BR;In Portuguese)

Personal Author Index

Authors' surnames are indexed in the form appearing in the publication cited; given names generally have been reduced to initials. For documents with multiple authors, each author name is indexed. The entry for a primary author (first author listed on an abstracted document) includes the full document title and citation number. Entries for other authors provide a cross-reference to the primary author. Also included is information on the document type, country of publication, and the document language listed in parentheses in the format (J;FR;In French and English). Accent marks are not input because of computer alphabetization. Spelling and transliteration follow standard conventions.

Subject Index

This index is arranged by subject descriptors selected from those assigned to each citation in this publication. Subject descriptors are selected from a controlled thesaurus of terms, ETDE/PUB–2, *International Energy: Subject Thesaurus*. In order to enhance indexing, subject descriptor entries generally consist of a pair of descriptors: a main term and a qualifier term. Each entry includes the full title (which may be followed by supplementary descriptive information in parentheses) and the citation number. Additional information given in parentheses indicates the document type (an abbreviation such as B for book), the country of publication (such as DE for Federal Republic of Germany), and the language if non-English.

See references guide users from synonymous terms to the descriptors selected for the concept. *See also* references indicate subject concepts that are more specific than a particular descriptor. To gain complete subject coverage, all such terms should be reviewed.

The effect of process aiders on start-up of anaerobic fluidized bed systems, 18:344 (IA;DK)
The role of gene technology in biological waste treatment, 18:347 (IA;DK)
ANALYSIS (THERMAL)
See THERMAL ANALYSIS
ANDERSONITE
Slave bosons treatment of the degenerate Anderson impurity with finite on-site Coulomb interaction, 18:1879 (IA;IL)
ANGRA-2 REACTOR
Ovalization and structural integrity of the zone 10 of the Angra-2 reactor pressure vessel. Part I: non-linear material analysis. Part II: non-linear material and geometric analysis, 18:481 (IA;BR;In Portuguese)

ANIONS
See also HYDROGEN IONS 1 MINUS
The role of catalyst precursor anions in coal gasification: Third quarterly report, 18:40 (R;US)

ANODES
Development of metal-coated ceramic anodes for molten carbonate fuel cells: Final report, 18:823 (R;US)
Evaluation of cerium oxide coated Cu cermets as inert anodes for aluminum electrowinning: Final report, August 1990–March 1992, 18:1040 (R;US)

ANODIZATION
Studies on dielectric properties of anodic films in metallic valves, 18:998 (IA;BR;In Portuguese)

ANTENNAS
Integrated test and package methods for integrated photonics, 18:1277 (R;US)
Quasi-optical concepts for lower hybrid waves launchers on large tokamaks, 18:2366 (R;FR)

ANTIFERROMAGNETIC MATERIALS
Dynamics in anisotropic antiferromagnets, 18:2258 (IA;BR;In Portuguese)
Superficial polaritons in magnetic wires, 18:2241 (IA;BR;In Portuguese)

ANTIMATTER
Production of relativistic anti-hydrogen atoms by pair production with positron capture and measurement of the Lamb shift, 18:2089 (R;US)

ANTIMONY 116
Structure of odd-odd Sb and In nuclei, 18:2008 (RA;PL)

ANTIMONY 118
Structure of odd-odd Sb and In nuclei, 18:2008 (RA;PL)

ANTIMONY ALLOYS
Effect of ion implantation on the corrosion behavior of lead and lead-antimony alloy, 18:741 (R;US)
Strained quantum well modulation-doped InGaSb/AlGaSb structures grown by molecular beam epitaxy, 18:1119 (R;US)

ANTRIM SHALES
See BLACK SHALES

APATITES
ESR of calcined tissue apatites, 18:2119 (IA;BR;In Portuguese)

APPENDIX (VERMIFORM)
See LARGE INTESTINE

APS STORAGE RING
See ADVANCED PHOTON SOURCE

AQUATIC ECOSYSTEMS
Annual report on radioactive discharges from Winfrith and monitoring the environment 1990, 18:1637 (R;GB)
Marine environment indicators and indices: Use of macrobenthos, 18:1635 (R;IT;In Italian)

AQUEOUS SOLUTIONS
Study of unstable valences of cadmium and samarium by pulse radiolysis. Influence of complexation by some synthetical ionophores, 18:1187 (R;FR;In French)

AQUIFERS
Geohydrologic characterization for aquifer thermal energy storage, 18:739 (R;US)

ARCTIC REGIONS
Active layer hydrology for Imnavait Creek, Toolik, Alaska: Annual progress report, July 1984–January 1986, 18:1557 (R;US)

ARGENTINA
Declaration by the governments of Argentina, Brazil and Chile on the entry into force for them of the treaty of Tlatelolco, 18:947 (R;XA)

ARGON
Concentration fluctuations at the liquid-vapour coexistence in Ne-Ar mixture, 18:2063 (R;XA)
The thermodynamic and structural contributions to the vacancy formation energies in hot rare gas solids, 18:2091 (R;XA)

ARGON 40
Charge exchange of very heavy ions in carbon foils and in the residual gas of the Ganil cyclotrons, 18:2032 (R;FR)

ARGON 40 REACTIONS
Differential cross section study of fragment production, at small angle, in relativistic heavy ion collisions. Application at a calculation of heavy ion beam transport in the matter, 18:2051 (R;FR;In French)
Hot nuclei production in Ar+Ag reactions at 50 and 70 MeV/u: limits of decay standard mode, 18:2048 (R;FR;In French)
Study of evolution of $^{40}Ar+^{nat}Ag$ reaction from 7 to 34 MeV/u with a 4π multidetector of charged particles, 18:2039 (R;FR;In French)

ARGON IONS
Oscillator strengths for P V, S VI, Cl VII, Ar VIII and K IX, 18:2082 (R;XA)

BETATRON OSCILLATIONS
An approximate invariant using Lie algebra, 18:1333 (R;US)
Effect of transients on the beam in the Superconducting Supercollider Coupled-Cavity Linac, 18:1323 (R;US)
Influence of a distribution of deflecting-mode frequencies on the transient dynamics of cumulative beam breakup, 18:1305 (R;US)
Mixture of two quasi degenerate waves in saturable absorbers, 18:1791 (IA;BR;In Portuguese)
Transverse phase-space evolution in non-stationary charged particle beams, 18:1304 (R;US)

BEAM EXTRACTION
Magnetic study of extraction elements of compact cyclotron beam with AGOR superconducting coils, 18:1363 (R;FR;In French)

BEAM FOCUSING MAGNETS
Analysis of the optics of the Final Focus Test Beam using Lie algebra based techniques, 18:1330 (R;US)

BEAM INJECTION
See also NEUTRAL ATOM BEAM INJECTION
Effects of parasitic beam-beam interaction during the injection process at the PEP-II B Factory, 18:1385 (R;US)
Injector and beam transport system. Progress report at 24th October 1991, 18:1352 (R;FR;In French)

BEAM INJECTION HEATING
Calculation of neutral beam deposition accounting for excited states, 18:2393 (R;US)

BEAM MONITORS
See also MAGNETOINDUCTION SENSORS
Beam monitor for subnanosecond proton bunches, 18:1356 (R;US)

BEAM OPTICS
Analysis of the optics of the Final Focus Test Beam using Lie algebra based techniques, 18:1330 (R;US)
Optics analysis of Final Focus Test Beam with the help of methods based on Lie algebra, 18:1321 (R;FR;In French)

BEAM PROFILES
A high resolution, single bunch, beam profile monitor, 18:1342 (R;US)

BEAM TRANSPORT
Beam transport magnets for the 3-pass race-track machine, 18:1312 (R;FR)
Injector and beam transport system. Progress report at 24th October 1991, 18:1352 (R;FR;In French)
Radiation damage considerations in a high luminosity collider: The interaction region, 18:1377 (R;US)
Using Lie Algebra methods to analytically study nonperturbative effects in beam lines, 18:1332 (R;US)

BEAM WIDTHS
See BEAM PROFILES

BEAM-BEAM INTERACTIONS
An investigation of coherent quadrupole beam–beam effects, 18:1329 (R;US)

Bench-marking beam-beam simulations using coherent quadrupole effects, 18:1326 (R;US)

BEAT WAVE ACCELERATORS
The acceleration of particles by relativistic electron plasma waves driven by the optical mixing of laser light in a plasma, 18:1303 (R;CA)

BEEF
See MEAT

BELGIAN REACTOR 3
See BR-3 REACTOR

BELGIUM
Pilot tests on radioactive waste disposal in underground facilities, 18:234 (R;FR)

BENTONITE
Consolidation of the Waste Isolation Pilot Plant crushed salt/bentonite mixtures as a function of confining pressure and moisture content as compared with constitutive model predictions, 18:262 (R;US)
Fissures and boreholes plugging in fractured geologic deposits (granites), 18:235 (R;FR;In French)
Review of the interactions between bentonite and cement, 18:226 (R;GB)

BENZOTHIOPHENES
See THIONAPHTHENES

BERYLLIUM
Experimental programme in support of the development of the European ceramic-breeder-inside-tube test-blanket: present status and future work, 18:2351 (R;FR)
Investigation of β-delayed neutron emission and elastic scattering of neutron-rich isotopes of He and Li, 18:1949 (R;SU)
Results of the radiological survey at the Sacandaga site Glenville, New York: Waste Management Research and Development Programs, 18:1574 (R;US)

BERYLLIUM 7
Applicability of cascade-evaporation model to the calculation of radiation damages due to ions with energies T>1 GeV, 18:1006 (R;SU)

BERYLLIUM MODERATORS
See BERYLLIUM

BETA BEAMS (ELECTRONS)
See ELECTRON BEAMS

BETA BEAMS (POSITRONS)
See POSITRON BEAMS

BETATRON OSCILLATIONS
A method for particle tracking through nonlinear fields in synchrotrons, 18:1318 (R;SU;In Russian)
An autonomous microprocessor system for measurement of betatron oscillation parameters using signal processor, 18:1372 (R;SU;In Russian)

BETHE-SALPETER EQUATION
Bethe-Salpeter equation for non-self conjugate mesons in a power-law potential, 18:1905 (R;XA)

BILE DUCTS
See BILIARY TRACT

BILIARY TRACT
Intrahepatic stones: a case report, 18:1691 (IA;BR;In Portuguese, English)

BINARY ALLOY SYSTEMS
Electronic structure of $A(B_{(1-x)}B'_{(x)})_2$ systems, 18:2231 (IA;BR;In Portuguese)

BINARY FISSION
Nuclear charge distribution in symmetric and asymmetric fission induced by light charged particles, 18:2055 (RA;PL)

BINARY MIXTURES
Concentration fluctuations at the liquid-vapour coexistence in Ne-Ar mixture, 18:2063 (R;XA)

BIODEGRADATION
Annual report and summaries of FY 1992 activities: Division of Energy Biosciences, 18:321 (R;US)

BIOGAS
See METHANE

BIOGAS PROCESS
The Danish programme on joint biogas plants, 18:903 (RA;FR)

BIOLOGICAL EVOLUTION
Spontaneous regulating mechanisms that may have led to the origin of life, 18:1718 (R;XA)

BIOLOGY
See also GENETICS
RADIOBIOLOGY
Mathematics and biology: The interface, challenges and opportunities, 18:1663 (R;US)

BIOMASS
Furnace for biological fuels, 18:352 (PA;CA)
Rates of reaction and process design data for the Hydrocarb Process, 18:326 (R;US)

BIOMASS CONVERSION PLANTS
A moderate land limited swine waste bio-treatment alternative for the tropics, 18:339 (IA;DK)
Biogas from source separated household waste: Project in Herning, 18:333 (IA;DK)
Expanded measuring programme on farm biomass conversion plants, 18:348 (I;DK;In Danish)
Full scale biogas plant for source separated solid waste, 18:334 (IA;DK)
Operational experience of a 360 t per day joint biogas plant, 18:336 (IA;DK)

BIOMASS PLANTATIONS
Energy forests - cultivation and working economy, 18:319 (R;DK;In Danish)
Environmental emissions from biomass energy feedstocks, 18:1552 (R;US)
Sludge and sewage fertilization in forests and energy plantations, 18:325 (R;DK;In Danish)

BIOTECHNOLOGY
Annual report and summaries of FY 1992 activities: Division of Energy Biosciences, 18:321 (R;US)
Biotechnology an Overview of Applications and Impact on Environment, 18:1667 (R;FR)

BIPYRIDINES
Pulsed laser kinetic studies of liquids under high pressure: Progress report, November 25, 1991–September 18, 1992, 18:1183 (R;US)

BIRDS
See also FOWL
Atlas of the breeding birds of Los Alamos County, New Mexico, 18:1572 (R;US)
Endangered species preactivity survey and monitoring program for Western Area Power Administration's Tracy-Livermore 230-kV transmission line construction: Final report, 18:734 (R;US)

BISMUTH 214
The probabilistic risk assessment due to indoor exposure to ^{222}Rn daughters in Korea, 18:1755 (R;KR;In Korean)

BISMUTH ALLOYS
Physics of YbBiPt, 18:1011 (R;US)

BISMUTH COMPOUNDS
See also BISMUTH OXIDES
Study of the modulated structure of $Bi_2(Sr,Ca)_3Cu_2O_{8+\gamma}$ in the range 8-920 K, 18:2223 (R;SU)

BISMUTH OXIDES
Enhanced superconducting properties in $Bi_2Sr_2Ca_1Cu_2O_y$ by thermal and mechanical processing, 18:1033 (R;US)
Large magnetic field induced fluctuation effect in superconducting $Bi_2Sr_2Ca_2Cu_3O_{10}$ tape, 18:1035 (R;US)

BITTER SPAR
See DOLOMITE

BITUMENS
Process for the selective conversion of the asphaltenes in bitumen upgrading, 18:153 (PA;CA)

BITUMINOUS COAL
Coal desulfurization in a rotary kiln combustor: Quarterly report No. 1, April 16, 1990–July 15, 1990, 18:85 (R;US)
Mild coal pretreatment to improve liquefaction reactivity: Quarterly technical progress report, March–May 1992, 18:31 (R;US)
Preconversion processing of bituminous coals: New directions to improved direct catalytic coal liquefaction: Quarterly report, January 1, 1992–March 31, 1992 (Effect of preconversion heat soak with coal liquids.), 18:36 (R;US)

BLACK SHALES
Phosphates and blackshales of the Oulab Abdoun and Timahdit basins (Morocco): Petrography, mineralogy, geochemistry and depositional environment, 18:149 (R;FR;In French)
BLANKETS (BREEDING)
See BREEDING BLANKETS
BLENDING
See MIXING
BLOCH EQUATIONS
Chaotic dynamics in the Maxwell-Bloch equations, 18:2190 (R;US)
Iterative method for inversion of Bloch equation, 18:1821 (IA;BR;In Portuguese)
BLOOD
Radiation absorbed dose and tumor response during therapy with iodine-131 conjugated 3F8 monoclonal antibody, 18:1677 (RA;US)
BNFL
Recent decommissioning experience in BNFL, 18:1210 (RA;FR)
BOHUNICE V-1 REACTOR
Sunshine and excessive dustiness in the Czech Republic, 18:610 (IA;CS;In Czech)
BOHUNICE V-2 REACTOR
Sunshine and excessive dustiness in the Czech Republic, 18:610 (IA;CS;In Czech)
BOILING WATER COOLED AND MODERATED REACTOR
See BWR TYPE REACTORS
BOLOMETERS
A high T_c superconducting bolometer, 18:1413 (IA;IL)
The mathematical modelling of radiation damages of HTSC bolometers, 18:1449 (R;SU;In Russian)
BOMBS
Dual-band infrared imaging applications: Locating buried minefields, mapping sea ice, and inspecting aging aircraft, 18:1454 (R;US)
BONE MARROW
Radiation absorbed dose and tumor response during therapy with iodine-131 conjugated 3F8 monoclonal antibody, 18:1677 (RA;US)
BONNEVILLE POWER ADMINISTRATION
Bonneville Power Administration 1991 site environmental report, 18:732 (R;US)
BOOSTERS (PARTICLE)
See PARTICLE BOOSTERS
BORANES
Boron in nuclear medicine: New synthetic approaches to PET and SPECT: Progress report, March 1, 1992–February 28, 1993, 18:1678 (R;US)
BOREHOLES
Directional borehole antenna - Theory, 18:1453 (R;SE)
Fissures and boreholes plugging in fractured geologic deposits (granites), 18:235 (R;FR;In French)
Site characterization and validation - Head variations during the entire experimental period, 18:1617 (R;SE)
BORIC ACID
Development of an experimental data base and theories for prediction of thermodynamic properties of aqueous electrolytes and nonelectrolytes of geochemical significance at supercritical temperatures and pressures: Annual performance report, 18:1156 (R;US)
BORON
Boronization in Tore-Supra, 18:2374 (RA;FR)
BORON 13
Investigation of β-delayed neutron emission and elastic scattering of neutron-rich isotopes of He and Li, 18:1949 (R;SU)
BORON ALLOYS
Damage dosimetry and embrittlement monitoring of nuclear pressure vessels in real time by magnetic properties measurement: Technical progress report for year 2, October 1, 1991–September 30, 1992, 18:555 (R;US)
BORON CARBIDES
Ceramics models in the MESA codes, 18:1069 (R;US)
Thermodesorption studies of boron doped graphite exposed to a low energy high density deuterium plasma, 18:2372 (RA;FR)
BORONIC ACIDS
Factors affecting the rate of hydrolysis of phenylboronic acid in lab-scale precipitate reactor studies, 18:276 (R;US)
BOROSILICATE GLASS
Early phyllosilicates formed by alteration of R7T7 glass in water at 250 deg C, 18:1079 (R;FR)
Effect of platinoids on French LWR reference glass properties, 18:1082 (R;FR)
Effect of surface finish on nuclear glass dissolution rate, 18:1081 (R;FR)
Experimental alteration of R7T7 glass in salt brines at 90 deg C and 150 deg C, 18:1080 (R;FR)
R7T7 glass alteration in the presence of mortar: effect of the cement grade, 18:1083 (R;FR)
The corrosion kinetics of borosilicate glasses for radioactive waste disposal, 18:244 (IA;CH)
BOROSILICATES
See BOROSILICATE GLASS
BOSE-EINSTEIN CONDENSATION
Pair formation and Bose condensation in square lattice, 18:2266 (IA;BR;In Portuguese)
BOSON EXPANSION
Normal ordering for deformed boson operators, 18:1878 (IA;IL)
BOSON-FERMION SYMMETRY
Spinning self-dual particles, 18:1965 (IA;BR;In Portuguese)
BOSONIZATION
See BOSON EXPANSION
BOUNDARY VALUE PROBLEMS
See BOUNDARY-VALUE PROBLEMS
BOUNDARY-VALUE PROBLEMS
Domain decomposition: A blowup problem and the Ginzburg–Landu equations, 18:2194 (R;US)
Geometrical approach to the dynamics of a relativistic string in the D-dimensional Minkowski space, 18:1884 (R;SU)
BPA
See BONNEVILLE POWER ADMINISTRATION
BR-3 REACTOR
The BR3 pressurized water reactor pilot dismantling project. Chemical decontamination of the primary loop development and commissioning of equipment for the segmenting of the reactor internals, 18:480 (RA;FR)
BRACKISH WATER ECOSYSTEMS
See AQUATIC ECOSYSTEMS
BRAIN
See also CEREBRUM
Radiation absorbed dose and tumor response during therapy with iodine-131 conjugated 3F8 monoclonal antibody, 18:1677 (RA;US)
Radiation-induced micrencephaly in guinea pigs, 18:1734 (R;US)
BRAZIL
Brazil Geological Basic Survey Program - Espera River - Sheet SF.23-X-B-IV - Minas Gerais State, 18:1570 (I;BR;In Portuguese)
Brazil Geological Basic Survey Program: special project of mineral resources, soils and vegetation maps for the region of Grande Carajas Program - Mineral resources sub project - Serra dos Carajas - Sheet SB.22-Z-A - Para State, 18:1569 (I;BR;In Portuguese)
Declaration by the governments of Argentina, Brazil and Chile on the entry into force for them of the treaty of Tlatelolco, 18:947 (R;XA)
BRAZILIAN CNEN
Execution of CP1 code at CNEN H-Bull computer, 18:2455 (IA;BR;In Portuguese)
Triennial technical report - 1986, 1987, 1988 - Instituto de Engenharia Nuclear (IEN) -Dept. of Reactors (DERE), 18:2405 (I;BR;In Portuguese)
BREAKDOWN
Two-dimensional computer calculation of high-power microwave bandwidth broadening by air breakdown in a rectangular waveguide, 18:1229 (R;US)
BREAKWATERS
See DAMS

BREASTS
See MAMMARY GLANDS

BREEDING BLANKETS
European research and development programme for water-cooled lithium-lead blankets: present status and future work, 18:2349 (R;FR)
Experimental programme in support of the development of the European ceramic-breeder-inside-tube test-blanket: present status and future work, 18:2351 (R;FR)
Further adaptation of the European ceramic-B.I.T. blanket conceptual design to updated Demo specifications, 18:2352 (R;FR)
Numerical analysis and nuclear standard code application to thermal fatigue, 18:2363 (R;FR)
Water-cooled lithium-lead blanket design studies for Demo reactor: definition and recent developments of the box-shaped concept, 18:2350 (R;FR)

BRICKS
Structural testing of hollow clay tile units: Volume 1, 18:1125 (R;US)
Test procedure for prism compression testing of laboratory built prisms: Hollow clay tile wall testing program, 18:1126 (R;US)

BRITISH NUCLEAR FUELS LIMITED
See BNFL

BRUCE-1 REACTOR
AECB staff review of Bruce NGS 'A' operation for the year 1989, 18:510 (R;CA)
Radioactive release data from Canadian nuclear generating stations 1872-1987, 18:609 (R;CA)

BRUCE-5 REACTOR
AECB staff review of Bruce NGS 'B' operation for the year 1989, 18:511 (R;CA)

BUCKLING
KEFFMGBSTGAN: nuclear criticality safety, 18:2432 (CM;US)

BUILDING (CONSTRUCTING)

Biomedical applications of radioactive nuclear beams, 18:1706 (R;FR)

CARBON 12 REACTIONS
Deexcitation processes in nuclear reactions: Annual progress report, 18:2030 (R;US)

CARBON 12 TARGET
About possibility of standing the production region dimensions of fast protons, 18:2046 (R;SU;In Russian)
The measurement of the differential cross section in the double quasi-elastic proton scattering on ^{12}C at the energy of (660+-7) MeV, 18:2045 (R;SU;In Russian)

CARBON CYCLE
Estimating phytoplankton photosynthesis by active fluorescence, 18:1625 (R;US)
Utilization, cycling and vertical transport of particulate organic matter in the coastal marine environment: Final project report, November 15, 1987–May 14, 1992, 18:1630 (R;US)

CARBON DIOXIDE
Absorption
Inventarisation of techniques for CO_2 removal from fuel gas or reformer gas, 18:50 (R;NL)
Air Pollution Control
Estimation of coal usage technologies in relation to CO_2 for global environment. (3), 18:95 (R;JP;In Japanese)
Biological Effects
Global climate change: Some implications, opportunities, and challenges for US forestry, 18:1551 (R;US)
The impact of climatic change on the aquatic environment, 18:1647 (RA;FI)
Vegetation, water and climatic change, 18:1649 (RA;FI)
Buildup
Survey of an evaluation method for CO_2 reduction technology in the chemical related industry field, 18:759 (R;JP;In Japanese)
Carbon Dioxide Fixation
Survey on fixation and utilization of carbon dioxide. (2), 18:760 (R;JP;In Japanese)
Chemisorption
Inventarisation of techniques for CO_2 removal from fuel gas or reformer gas, 18:50 (R;NL)
Comparative Evaluations
Effect of CO_2 pD control on area activity levels, 18:617 (R;US)
Emission
Economic effects of carbon dioxide emission abatement: Economic effects in Finland, 18:1497 (R;FI;In Finnish)
Environmental emissions from biomass energy feedstocks, 18:1552 (R;US)
Estimation of coal usage technologies in relation to CO_2 for global environment. (3), 18:95 (R;JP;In Japanese)
Survey of an evaluation method for CO_2 reduction technology in the chemical related industry field, 18:759 (R;JP;In Japanese)
Environmental Effects
Rangeland – Plant responses to elevated CO_2: Progress report, 18:1558 (R;US)
Hydrogenation
Survey on fixation and utilization of carbon dioxide. (2), 18:760 (R;JP;In Japanese)
Information
Carbon Dioxide Information Analysis Center: FY 1991 activities, 18:1500 (R;US)
Materials Recovery
Evaluation of options for CO_2 capture/utilization/disposal, 18:1472 (R;US)
Survey on fixation and utilization of carbon dioxide. (2), 18:760 (R;JP;In Japanese)
Pollution Abatement
Survey of an evaluation method for CO_2 reduction technology in the fossil fuel much-consuming industry field, 18:930 (R;JP;In Japanese)
Survey of an evaluation method for CO_2 reduction technology in the chemical related industry field, 18:759 (R;JP;In Japanese)
Retention
Evaluation of options for CO_2 capture/utilization/disposal, 18:1472 (R;US)
Separation Processes
A calcium oxide sorbent process for bulk separation of carbon dioxide: Annual report, September 1989–August 1990, 18:25 (R;US)
Survey on fixation and utilization of carbon dioxide. (2), 18:760 (R;JP;In Japanese)
Stationary Pollutant Sources
Survey on fixation and utilization of carbon dioxide. (2), 18:760 (R;JP;In Japanese)
Taxes
Have hydraulic and nuclear power to be charged for greenhouse effect, 18:754 (R;FR)
Technology Assessment
Survey of an evaluation method for CO_2 reduction technology in the fossil fuel much-consuming industry field, 18:930 (R;JP;In Japanese)
Thermodynamic Properties
Development of an experimental data base and theories for prediction of thermodynamic properties of aqueous electrolytes and nonelectrolytes of geochemical significance at supercritical temperatures and pressures: Annual performance report, 18:1156 (R;US)
Underground Disposal
Survey on CO_2 disposal method using salt groundwater, 18:889 (R;JP;In Japanese)
Units
Survey of an evaluation method for CO_2 reduction technology in the fossil fuel much-consuming industry field, 18:930 (R;JP;In Japanese)
Waste Product Utilization
Survey on fixation and utilization of carbon dioxide. (2), 18:760 (R;JP;In Japanese)

CARBON MONOXIDE
Probe molecule studies: Active species in alcohol synthesis: 7th quarterly report, April 1992–June 1992, 18:32 (R;US)
Resonance electron scattering by adsorbed molecules: σ^* resonance energy versus bond length, 18:1150 (R;US)

CARBON OXIDE SULFIDE
See CARBON OXYSULFIDE

CARBON OXYSULFIDE
Desulfurization of hot fuel gas produced from high-chlorine Illinois coals: Technical report, March 1, 1992–May 31, 1992, 18:49 (R;US)

CARBON STEELS
Chemical cleaning, decontamination and corrosion, 18:956 (R;IN)
The kinetics of pitting corrosion of carbon steel applied to evaluating containers for nuclear waste disposal, 18:1023 (R;SE)

CARBON TETRACHLORIDE
Technical action plan at former Commodity Credit Corporation grain storage sites in Nebraska and Kansas, 18:1550 (R;US)

CARBONIC ACID
Development of an experimental data base and theories for prediction of thermodynamic properties of aqueous electrolytes and nonelectrolytes of geochemical significance at supercritical temperatures and pressures: Annual performance report, 18:1156 (R;US)

CARBONYL SULFIDE
See CARBON OXYSULFIDE

CARBOXYLIC ACIDS
See also AMINO ACIDS
High-temperature pyrolysis mechanisms of coal model compounds: 1990 annual report, 18:22 (R;US)

CARIBBEAN SEA
IOC-UNEP regional workshop to review priorities for marine pollution monitoring, research, control and abatement in the wider Caribbean: Pt. 1 report, Pt. 2 marine pollution assessment and control programme for the wider Caribbean region - CEPPOL, 18:758 (R;XU)

CASINGS (WELL)

CATALYSIS
Morphological aspects of surface reactions: Progress report, September 1991–August 1992, 18:1154 (R;US)
CATALYST SUPPORTS
Hydrogen interaction with catalyst support Platinum. Influence of particle size, additives and type of catalyst support, 18:113 (R;FR;In French)
CATALYSTS
Catalytic removal of hydrogen in humid, hydrogen-air gas streams, 18:563 (RA;FR)
Demonstration of Selective Catalytic Reduction (SCR) technology for the control of nitrogen oxide (NO_x) emissions from high-sulfur coal-fired boilers: Innovative Clean Coal Technology (ICCT): Quarterly report No. 7, January–March 1992, 18:429 (R;US)
Development of a stable cobalt-ruthenium Fischer-Tropsch catalyst: Technical progress reports No. 7 and 8, April 1, 1991–September 30, 1991, 18:26 (R;US)
Development of a stable cobalt-ruthenium Fischer-Tropsch catalyst: Technical progress report No. 9, October 1, 1991–December 31, 1991, 18:27 (R;US)
Fine-particle iron catalysts: Testing program at Sandia National Laboratories, 18:52 (R;US)
Hydrogen mitigation technical means of nuclear power plants, 18:473 (RA;FR)
Hydrogen mitigation using catalyst modules, 18:561 (RA;FR)
Petroleum hydrocracking face to face Molybdenum based dispersed catalyst, 18:114 (R;FR;In French)
Rate enhancement for catalytic upgrading coal naphthas: Quarterly project report, October–December 1991, 18:39 (R;US)
Removal of hydrogen with catalytic recombiners during severe accident situations, 18:562 (RA;FR)
Technology development for iron Fischer-Tropsch catalysts: Technical progress report No. 4, June 26, 1991–September 26, 1991, 18:30 (R;US)
The reaction between H_2 and O_2 over tungsten carbide catalysts, 18:560 (RA;FR)
CATAPHORESIS
See ELECTROPHORESIS
CAVITIES
See also BOREHOLES
Permanent pool cavity seal design development, 18:579 (R;KR;In Korean)
CAVITY RESONATORS
See also SUPERCONDUCTING CAVITY RESONATORS
High temperature heat treatment of 3GHz niobium cavities, 18:1376 (R;US)
Influence of a distribution of deflecting-mode frequencies on the transient dynamics of cumulative beam breakup, 18:1305 (R;US)
CCD

CELLS (BACTERIAL)
See BACTERIA
CELLS (REACTOR)
See REACTOR CELLS
CEMENTS
Development of test methods for quality control of LLW and MLW in cement or polymers (Parts 1 and 2). Task 3. Characterization of radioactive waste forms. A series of final reports (1985-1989) no. 39, 18:236 (R;FR)
On-line analysis of cement raw materials by prompt gamma neutron activation analysis, 18:314 (RA;FR)
Review of the interactions between bentonite and cement, 18:226 (R;GB)
CENNA
Convention on early notification of a nuclear accident and convention on assistance in the case of a nuclear accident or radiological emergency, 18:2491 (R;XA)
CENTRAL HEATING PLANTS
District cooling engineering and design program: Final report, 18:899 (R;US)
CENTRAL RECEIVER TEST FACILITY
An overview of current activities at the National Solar Thermal Test Facility, 18:378 (R;US)
CENTRAL REGION
See USA
CERAMICS
Experimental programme in support of the development of the European ceramic-breeder-inside-tube test-blanket: present status and future work, 18:2351 (R;FR)
High temperature alkali corrosion of ceramics in coal gas: Quarterly progress report No. 4, June 1, 1992–August 31, 1992, 18:1041 (R;US)
Mechanisms of mechanical fatigue in ceramics: Annual technical progress report No. 2, August 15, 1990–August 14, 1991, 18:1039 (R;US)
Modeling of forced flow/thermal gradient chemical vapor infiltration, 18:1118 (R;US)
Quantitative determination of phases by x-ray diffraction, 18:1048 (IA;BR;In Portuguese)
Resistivity and specific heat in YBaCuO-Ag samples, 18:1061 (IA;BR;In Portuguese)
Specific heat of $YBa_2Cu_3O_{7-x}$ at low temperatures, 18:1056 (IA;BR;In Portuguese)
Studies on sintering and characterization of $Y_2Cu_2O_5$ and $BaCuO_2$ type ceramics, 18:1047 (IA;BR;In Portuguese)
Thermal plasma processing of materials: Progress report, September 1, 1988–January 31, 1992, 18:1093 (R;US)
CEREALS
See also MAIZE
Technical action plan at former Commodity Credit Corporation grain storage sites in Nebraska and Kansas, 18:1550 (R;US)
CEREBRUM
New techniques for positron emission tomography in the study of human neurological disorders: Progress report, 15 June 1992–31 October 1992, 18:1679 (R;US)
CERIUM 131
High spin states in ^{131}Ce, 18:2009 (RA;PL)
CERMETS
Evaluation of cerium oxide coated Cu cermets as inert anodes for aluminum electrowinning: Final report, August 1990–March 1992, 18:1040 (R;US)
CERRO PRIETO GEOTHERMAL FIELD
Boiling and condensation processes in the Cerro Prieto beta reservoir under exploitation, 18:404 (R;US)
CESIUM
Development of test methods for quality control of LLW and MLW in cement or polymers (Parts 1 and 2). Task 3. Characterization of radioactive waste forms. A series of final reports (1985-1989) no. 39, 18:236 (R;FR)
CESIUM 134
Removal of cesium from low level waste solutions by copper hexacyanoferrate loaded resins, 18:1188 (R;IN)
CESIUM 135
Application of crown ethers to selective extraction and quantitative analysis of technetium 99, iodine 129 and cesium 135 in effluents, 18:1134 (R;FR;In French)
CESIUM 137
Field sampling and analysis plan for the remedial investigation of Waste Area Grouping 2 at Oak Ridge National Laboratory, Oak Ridge, Tennessee: Environmental Restoration Program, 18:225 (R;US)
Removal of cesium from low level waste solutions by copper hexacyanoferrate loaded resins, 18:1188 (R;IN)
River versus atmospheric inputs to the Western Mediterranean: Annex 3, 18:1639 (RA;XU)
The Cambric migration experiment: A summary report, 18:1573 (R;US)
CESIUM ALLOYS
Orientational phase transitions in alloys, 18:955 (R;US)
CFC

SUBBITUMINOUS COAL
Alkaline Hydrolysis
The effects of moderate coal cleaning on the microbial removal of organic sulfur: [Quarterly] technical report, March 1, 1992–May 30, 1992, 18:43 (R;US)
Ammonolysis
The effects of moderate coal cleaning on the microbial removal of organic sulfur: [Quarterly] technical report, March 1, 1992–May 30, 1992, 18:43 (R;US)
Ash Content
Graphic values for some organic constituents of beneficiated coal samples: Technical report, March 1, 1992–May 31, 1992, 18:67 (R;US)
Ashes
Radiative properties of ash and slag: Eighth quarterly report, July 1, 1989–September 30, 1989, 18:56 (R;US)
Biodegradation
Microbial strain improvement for organosulfur removal from coal: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:42 (R;US)
The effects of moderate coal cleaning on the microbial removal of organic sulfur: [Quarterly] technical report, March 1, 1992–May 30, 1992, 18:43 (R;US)

Calorific Value
Graphic values for some organic constituents of beneficiated coal samples: Technical report, March 1, 1992–May 31, 1992, 18:67 (R;US)

Chemical Analysis
CFBC evaluation of fuels processed from Illinois coals: Technical report, March 1, 1992–May 31, 1992, 18:92 (R;US)

Chemical Composition
Emissions of airborne toxics from coal-fired boilers: Mercury, 18:427 (R;US)
Fate of chlorine-containing species in coal-fired MHD system, 18:818 (R;US)
Gasifier feed - Tailor-made from Illinois coals: [Quarterly] report, March 1, 1992–May 31, 1992, 18:46 (R;US)
High temperature corrosion during use of chlorine: Technical report, March 1, 1992–May 31, 1992, 18:74 (R;US)
Transformations of inorganic coal constituents in combustion systems: Quarterly report No. 22, January 1–March 31, 1992, 18:61 (R;US)

Chemical Reaction Kinetics
Clean, premium-quality chars: Demineralized and carbon enriched: Quarterly report, March 1, 1992–May 31, 1992, 18:68 (R;US)

Chemical Reactions
Clean, premium-quality chars: Demineralized and carbon enriched: Quarterly report, March 1, 1992–May 31, 1992, 18:68 (R;US)

Cocombustion
Combustion of Illinois coals and chars with natural gas: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:90 (R;US)
Cooperative research on the combustion characteristics of cofired desulfurized Illinois coal and char with natural gas: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:89 (R;US)

Combustion
Behavior of sulfur and chlorine in coal during combustion and boiler corrosion: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:91 (R;US)
Combustion of dense streams of coal particles: Quarterly progress report No. 7, February 29, 1991–May 28, 1992, 18:86 (R;US)
Computer simulation of an advanced combustor for clean coal technology, 18:816 (R;US)
Emissions of airborne toxics from coal-fired boilers: Mercury, 18:427 (R;US)
Nitration of polynuclear aromatic hydrocarbons in coal combustors and exhaust streams: Quarterly report, September 1, 1991–December 31, 1991, 18:434 (R;US)
Sorption and chemical transformation of PAHs on coal fly ash: Technical progress report No. 3, May 1–July 31, 1992, 18:435 (R;US)
The development of a coal-fired combustion system for industrial process heating applications: Quarterly technical progress report, January 1992–March 1992, 18:87 (R;US)

Combustion Products
Fate of chlorine-containing species in coal-fired MHD system, 18:818 (R;US)

Combustion Properties
Combustion characterization of the blend of plant coal and recovered coal fines: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:88 (R;US)
Influence of sulfur in coals on char morphology and combustion: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:62 (R;US)

Corrosive Effects
High temperature corrosion during use of chlorine: Technical report, March 1, 1992–May 31, 1992, 18:74 (R;US)

Covalence
Survey on a new development of coal utilization technology in the coal science field. (2), 18:69 (R;JP;In Japanese)

Deashing
Development of the chemical and electrochemical coal cleaning (CECC) process: Final report, 18:2 (R;US)

Dechlorination
Thermal treatment for chlorine removal from coal: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:8 (R;US)

Depolymerization
Analysis of organic sulfur and nitrogen in coal via tandem degradation methods: [Quarterly] technical report, 1 March–31 May 1992, 18:65 (R;US)

Desulfurization
Cooperative research on the combustion characteristics of cofired desulfurized Illinois coal and char with natural gas: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:89 (R;US)
Development of the chemical and electrochemical coal cleaning (CECC) process: Final report, 18:2 (R;US)
Mild pyrolysis of selectively oxidized coals: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:41 (R;US)
Protocols for the selective cleavage of carbon-sulfur bonds in coal: Technical report, March 1, 1992–May 30, 1992, 18:44 (R;US)

Dissolution
Fundamental studies of coal liquefaction solvents: Quarterly report No. 3, April 1–July 1, 1992, 18:53 (R;US)

Drying
An investigation of the role of water on retrograde/condensation reactions and enhanced liquefaction yields: Quarterly progress report, April 1, 1992–June 30, 1992, 18:37 (R;US)

Electron Spin Resonance
Vhf EPR analysis of organic sulfur in coal: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:64 (R;US)

Fluidized-Bed Combustion
Atmospheric fluidized bed combustion advanced concept system: Final report, 18:83 (R;US)
CFBC evaluation of fuels processed from Illinois coals: Technical report, March 1, 1992–May 31, 1992, 18:92 (R;US)
Evaluation and utilization of Illinois FBC residues for construction materials: Technical progress report, March 1, 1992–May 31, 1992, 18:94 (R;US)
Predictive models of circulating fluidized bed combustors: 12th technical progress report, 18:84 (R;US)
Stabilization and/or regeneration of spent sorbents from coal gasification: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:47 (R;US)
The use of FBC wastes in the reclamation of coal slurry solids: Technical report, March 1, 1992–May 31, 1992, 18:93 (R;US)

Fractionation
Graphic values for some organic constituents of beneficiated coal samples: Technical report, March 1, 1992–May 31, 1992, 18:67 (R;US)

Global Aspects
Estimation of coal usage technologies in relation to CO_2 for global environment. (3), 18:95 (R;JP;In Japanese)

Heat Treatments
Preconversion processing of bituminous coals: New directions to improved direct catalytic coal liquefaction: Quarterly report, April 1, 1992–June 30, 1992, 18:34 (R;US)

Microstructure
Molecular accessibility in solvent swelled coal: Quarterly report, 18:60 (R;US)

Mixing
Combustion characterization of the blend of plant coal and recovered coal fines: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:88 (R;US)

Molecular Structure
Survey on a new development of coal utilization technology in the coal science field. (2), 18:69 (R;JP;In Japanese)

Nuclear Magnetic Resonance
An investigation of the role of water on retrograde/condensation reactions and enhanced liquefaction yields: Quarterly progress report, April 1, 1992–June 30, 1992, 18:37 (R;US)
Thermodynamics and surface structure of coals: Quarterly report, October 1, 1991–December 31, 1991, 18:59 (R;US)

Organic Nitrogen Compounds
Analysis of organic sulfur and nitrogen in coal via tandem degradation methods: [Quarterly] technical report, 1 March–31 May 1992, 18:65 (R;US)

Organic Sulfur Compounds
Analysis of organic sulfur and nitrogen in coal via tandem degradation methods: [Quarterly] technical report, 1 March–31 May 1992, 18:65 (R;US)
Mass spectral study of organic sulfur in the polymeric matrix of coal: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:63 (R;US)
Vhf EPR analysis of organic sulfur in coal: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:64 (R;US)
Oxidation
Clean, premium-quality chars: Demineralized and carbon enriched: Quarterly report, March 1, 1992–May 31, 1992, 18:68 (R;US)
Porosity
Molecular accessibility in solvent swelled coal: Quarterly report, 18:60 (R;US)
Purification
Thermal treatment for chlorine removal from coal: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:8 (R;US)
Pyrolysis
Behavior of sulfur and chlorine in coal during combustion and boiler corrosion: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:91 (R;US)
Development of a high-performance coal-fired power generating system with pyrolysis gas and char-fired high temperature furnace (HITAF): Quarterly progress report 2, April–June 1992, 18:425 (R;US)
Hydrous pyrolysis of four Argonne Premium coals, 18:21 (R;US)
Mild pyrolysis of selectively oxidized coals: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:41 (R;US)
Vhf EPR analysis of organic sulfur in coal: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:64 (R;US)
Pyrolysis Products
Behavior of sulfur and chlorine in coal during combustion and boiler corrosion: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:91 (R;US)
Slags
Radiative properties of ash and slag: Eighth quarterly report, July 1, 1989–September 30, 1989, 18:56 (R;US)
Sorptive Properties
The role of catalyst precursor anions in coal gasification: Third quarterly report, 18:40 (R;US)
Structural Models
High-temperature pyrolysis mechanisms of coal model compounds: 1990 annual report, 18:22 (R;US)
Sulfur Content
Influence of sulfur in coals on char morphology and combustion: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:62 (R;US)
Surface Properties
Characterization of the surface properties of Illinois basin coals: Technical report, March 1, 1992–May 31, 1992, 18:66 (R;US)
Liquid chromatographic analysis of coal surface properties: Quarterly progress report, September–December 1991, 18:5 (R;US)
Thermodynamics and surface structure of coals: Quarterly report, October 1, 1991–December 31, 1991, 18:59 (R;US)
Swelling
Molecular accessibility in solvent swelled coal: Quarterly report, 18:60 (R;US)
Preconversion processing of bituminous coals: New directions to improved direct catalytic coal liquefaction: Quarterly report, April 1, 1992–June 30, 1992, 18:34 (R;US)
Thermal Gravimetric Analysis
Combustion characterization of the blend of plant coal and recovered coal fines: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:88 (R;US)
Two-Phase Flow
A computational model for coal transport and combustion: Quarterly technical progress report, June 1, 1992–August 31, 1992, 18:1239 (R;US)
Uses
Estimation of coal usage technologies in relation to CO_2 for global environment. (3), 18:95 (R;JP;In Japanese)

COAL FINES
A novel technique for evaluating cleaned fine and ultrafine coal: [Quarterly] technical report, 1 March 1992–31 May 1992, 18:9 (R;US)
CFBC evaluation of fuels processed from Illinois coals: Technical report, March 1, 1992–May 31, 1992, 18:92 (R;US)
Combustion characterization of the blend of plant coal and recovered coal fines: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:88 (R;US)
Dewatering studies of fine clean coal: Technical report, March 1, 1992–May 31, 1992, 18:7 (R;US)
Pelletization of fine coals: Technical progress report, March 1, 1992–May 31, 1992, 18:3 (R;US)

COAL GASIFICATION
A calcium oxide sorbent process for bulk separation of carbon dioxide: Annual report, September 1989–August 1990, 18:25 (R;US)
Desulfurization of hot fuel gas produced from high-chlorine Illinois coals: Technical report, March 1, 1992–May 31, 1992, 18:49 (R;US)
Development of novel copper-based sorbents for hot-gas cleanup: Technical report, March 1, 1992–May 31, 1992, 18:48 (R;US)
Gasifier feed - Tailor-made from Illinois coals: [Quarterly] report, March 1, 1992–May 31, 1992, 18:46 (R;US)
The role of catalyst precursor anions in coal gasification: Third quarterly report, 18:40 (R;US)
Upgrading of raw oil into advanced fuel: Task 5, 18:23 (R;US)

COAL GASIFICATION PLANTS
Proceedings of the sixth annual conference on fossil energy materials: Fossil Energy AR and TD Mateials Program, 18:51 (R;US)

COAL LIQUEFACTION
Advanced direct liquefaction concepts for PETC generic units: Quarterly technical progress report, April 1992–June 1992, 18:33 (R;US)
An investigation of the role of water on retrograde/condensation reactions and enhanced liquefaction yields: Quarterly progress report, April 1, 1992–June 30, 1992, 18:37 (R;US)
Coal-derived promoters for the liquefaction of Illinois coal: Technical report, March 1–May 31, 1992 (Use of other coal liquids as organic solvents in liquefaction.), 18:45 (R;US)
Fine-particle iron catalysts: Testing program at Sandia National Laboratories, 18:52 (R;US)
Mild coal pretreatment to improve liquefaction reactivity: Quarterly technical progress report, March–May 1992, 18:31 (R;US)
Preconversion processing of bituminous coals: New directions to improved direct catalytic coal liquefaction: Quarterly report, September 20, 1991–December 31, 1991, 18:35 (R;US)
Preconversion processing of bituminous coals: New directions to improved direct catalytic coal liquefaction: Quarterly report, April 1, 1992–June 30, 1992, 18:34 (R;US)
Preconversion processing of bituminous coals: New directions to improved direct catalytic coal liquefaction: Quarterly report, January 1, 1992–March 31, 1992 (Effect of preconversion heat soak with coal liquids.), 18:36 (R;US)

COAL LIQUEFACTION PLANTS
Proceedings of the sixth annual conference on fossil energy materials: Fossil Energy AR and TD Mateials Program, 18:51 (R;US)

COAL LIQUIDS
Coal liquefaction process streams characterization and evaluation: Application of liquid chromatographic separation methods to THF-soluble portions of integrated two-stage coal liquefaction resids, 18:29 (R;US)
Coal liquefaction process streams characterization and evaluation: FT-IR methods for characterization of coal liquefaction products, 18:28 (R;US)
Rate enhancement for catalytic upgrading coal naphthas: Quarterly project report, January–March 1992, 18:38 (R;US)
Rate enhancement for catalytic upgrading coal naphthas: Quarterly project report, October–December 1991, 18:39 (R;US)
Upgrading of raw oil into advanced fuel: Task 5, 18:23 (R;US)

COAL MINERS
Handbook for coal mine safety maintenance techniques. 8.: Underground monitoring system, 18:78 (I;JP;In Japanese)
COAL MINES
Handbook for coal mine safety maintenance techniques. 7.: Control of underground environments, 18:77 (I;JP;In Japanese)
Handbook for coal mine safety maintenance techniques. 8.: Underground monitoring system, 18:78 (I;JP;In Japanese)
Handbook for coal mine safety maintenance techniques. 9.: Safety maintaining technology, 18:96 (I;JP;In Japanese)
COAL PREPARATION
Development of the chemical and electrochemical coal cleaning (CECC) process: Final report, 18:2 (R;US)
Development of the selective coagulation process: Final report, 18:4 (R;US)
Eighth annual coal preparation, utilization, and environmental control contractors conference: Proceedings, 18:1 (R;US)
Graphic values for some organic constituents of beneficiated coal samples: Technical report, March 1, 1992–May 31, 1992, 18:67 (R;US)
Liquid chromatographic analysis of coal surface properties: Quarterly progress report, September–December 1991, 18:5 (R;US)
Non-intrusive measurement of particle charge: Electrostatic dry coal cleaning: Technical progress report No. 4, April 1, 1992–June 30, 1992, 18:6 (R;US)
COAL PREPARATION PLANTS
The use of FBC wastes in the reclamation of coal slurry solids: Technical report, March 1, 1992–May 31, 1992, 18:93 (R;US)
COAL SEAMS
Survey of alcohol production technology using coalbed methane as raw material, 18:357 (R;JP;In Japanese)
COAL TAR
Nitration of polynuclear aromatic hydrocarbons in coal combustors and exhaust streams: Quarterly report, September 1, 1991–December 31, 1991, 18:434 (R;US)
COAL-DERIVED LIQUIDS

TANKS
Development of methodology for certification of Type B shipping containers using analytical and testing techniques, 18:1215 (R;US)
Drop testing of the Westinghouse fresh nuclear fuel package, 18:1204 (R;US)
Stability of metallic copper in the near surface environment, 18:1177 (R;SE)
The development of an on-site container, 18:1463 (R;US)
Transportation package design using numerical optimization, 18:1226 (R;US)

CONTAINMENT
See also CONTAINMENT BUILDINGS
CONTAINMENT SYSTEMS
Phenomenological direct containment heating models in CONTAIN and their assessment against experimental data, 18:726 (R;US)
Results of an experiment in a Zion-like geometry to investigate the effect of water on the containment basement floor on direct containment heating (DCH) in the Surtsey Test Facility: The IET-4 test, 18:725 (R;US)
Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 2, 18:1465 (R;US)
Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1, 18:1464 (R;US)

CONTAINMENT BUILDINGS
Experimental results from pressure testing a 1:6-scale nuclear power plant containment, 18:583 (R;US)
Proving test on the reliability for reactor containment vessel (2) hydrogen burning test, 18:454 (RA;FR)
The assessment of containment codes by experiments simulating severe accident scenarios, 18:457 (R;FR)

CONTAINMENT SYSTEMS
Waste Isolation Pilot Plant: Alcove Gas Barrier trade-off study, 18:263 (R;US)

CONTROL (RADIOACTIVITY)
See RADIATION MONITORING

CONTROL ELEMENTS
Accidental dropping of control rods: Minutes of meeting, 18:707 (R;US)
Method of supercell dilution, 18:604 (IA;BR;In Portuguese)

CONTROL ROD DRIVES
Control actuator design, 18:596 (R;US)

CONTROL RODS
See CONTROL ELEMENTS

CONTROL SYSTEMS
See also REACTOR CONTROL SYSTEMS

Upgraded phase control system for superconducting low-velocity accelerating structures, 18:1335 (R;US)

CONTROL THEORY (REACTOR)
See REACTOR KINETICS

CONVECTION
See also NATURAL CONVECTION
Modified operator analysis on convection-diffusion problems, 18:1249 (IA;BR)
Utilization manual of the computer program FLUIDO-2D, 18:1252 (IA;BR;In Portuguese)

CONVECTIVE LOOP HOUSES
See DOUBLE ENVELOPE BUILDINGS

CONVENTION ON EARLY NOTIFICATION OF NUCLEAR ACCIDENT
See CENNA

COOLANT LOOPS
Computerized Simulation
Experimental evaluation of the TV-CTS-1 code for thermohydraulic parameters calculation of CTS-1 thermal sodium loop, 18:565 (IA;BR;In Portuguese)
Construction
Preparation for assembling of the new sodium loops, 18:574 (IA;BR;In Portuguese)
Drainage
Calculation of drainage time for sodium loops, 18:567 (IA;BR;In Portuguese)
Design and construction of a filling and drainage system for the water loop, 18:568 (IA;BR;In Portuguese)
Emergency Plans
Safety instruction for CTS-1 sodium thermal circuit operation, 18:573 (IA;BR;In Portuguese)
Flow Rate
Flow rate calculation during the line drainage of the SS-50 sodium circuit confluent to the 05-M mixer, 18:1242 (IA;BR;In Portuguese)
Fluid Flow
Development of computer program for solution of a mathematical model to thermohydraulics calculation in sodium loops, 18:1245 (IA;BR;In Portuguese)
Friction Factor
Friction factor in seven rods bundle in fast reactors typical geometry, 18:533 (IA;BR;In Portuguese)
Heat Exchangers
Verification of maximum stresses in the CTS-1 sodium loop heat exchangers during the solidified sodium removal operation, 18:1212 (IA;BR;In Portuguese)
Maintenance
Operation and maintenance of the CTS-1 sodium loop, 18:569 (IA;BR;In Portuguese)
Natural Convection
Development of computer program for solution of a mathematical model to thermohydraulics calculation in sodium loops, 18:1245 (IA;BR;In Portuguese)
Energy equation steady solution for calculation of natural convection in sodium loops, 18:542 (IA;BR;In Portuguese)
Operation
Operation and maintenance of the CTS-1 sodium loop, 18:569 (IA;BR;In Portuguese)
Safety instruction for CTS-1 sodium thermal circuit operation, 18:573 (IA;BR;In Portuguese)
Pipes
Operation and maintenance of the CTS-1 sodium thermal loop, 18:1244 (IA;BR;In Portuguese)
Programming
Optimization of the TV-CTS-1 calculation code, 18:2459 (IA;BR;In Portuguese)
Reduction of execution time of the program for the calculation of natural convection transients at CTS-1 sodium loop, 18:566 (IA;BR;In Portuguese)
Quality Assurance
Preparation for assembling of the new sodium loops, 18:574 (IA;BR;In Portuguese)
Quality Control
Verification of the control quality documentation of the new sodium loops of IEN (Nuclear Engineering Institute), 18:575 (IA;BR;In Portuguese)
Restraints
Operation and maintenance of the CTS-1 sodium thermal loop, 18:1244 (IA;BR;In Portuguese)
Scale Models
Thermal deformation analysis in scale model of the CTS-1 sodium loop, 18:570 (IA;BR;In Portuguese)
Sodium
Analysis of pressure waves propagation in hydraulic circuits for thermal shock with sodium, 18:577 (IA;BR;In Portuguese)
Calculation of drainage time for sodium loops, 18:567 (IA;BR;In Portuguese)
Compatibility study of magnesium oxide with sodium, 18:572 (IA;BR;In Portuguese)
Energy equation steady solution for calculation of natural convection in sodium loops, 18:542 (IA;BR;In Portuguese)
Experimental evaluation of the TV-CTS-1 code for thermohydraulic parameters calculation of CTS-1 thermal sodium loop, 18:565 (IA;BR;In Portuguese)
Flow rate calculation during the line drainage of the SS-50 sodium circuit confluent to the 05-M mixer, 18:1242 (IA;BR;In Portuguese)
Reduction of execution time of the program for the calculation of natural convection transients at CTS-1 sodium loop, 18:566 (IA;BR;In Portuguese)
Stresses
Analysis and verification of CTS-1 IEN/CNEN sodium loop design stresses in normal and emergency conditions, 18:1004 (IA;BR;In Portuguese)
Thermal Analysis
Analysis and verification of CTS-1 IEN/CNEN sodium loop design stresses in normal and emergency conditions, 18:1004 (IA;BR;In Portuguese)
Thermal Insulation
Calculation of CTS-1 thermal insulation, 18:571 (IA;BR;In Portuguese)
Thermal Shock
Analysis of pressure waves propagation in hydraulic circuits for thermal shock with sodium, 18:577 (IA;BR;In Portuguese)
Sodium temperature evaluation during a cold thermal shock, 18:1248 (IA;BR;In Portuguese)
Thermal Testing
Sodium temperature evaluation during a cold thermal shock, 18:1248 (IA;BR;In Portuguese)
Water
Design and construction of a filling and drainage system for the water loop, 18:568 (IA;BR;In Portuguese)
Wave Propagation
Analysis of pressure waves propagation in hydraulic circuits for thermal shock with sodium, 18:577 (IA;BR;In Portuguese)
Welding
Verification of the control quality documentation of the new sodium loops of IEN (Nuclear Engineering Institute), 18:575 (IA;BR;In Portuguese)

COOLANT-FUEL INTERACTIONS
See FUEL-COOLANT INTERACTIONS

COOLERS

COOLING SYSTEM (REACTOR)
See REACTOR COOLING SYSTEMS

COPPER
Chemical probes of metal cluster structure--Fe, Co, Ni, and Cu, 18:952 (R;US)
Deexcitation processes in nuclear reactions: Annual progress report, 18:2030 (R;US)
Diagnostic behavior of the Wire Arc Plasma spray process, 18:1227 (R;US)
Diffusion-induced grain boundary migration during ion beam mixing of Au/Cu bilayers, 18:310 (R;US)
Experimental measurements of total attenuation cross section and photoelectric cross section for Fe, Cu, Sn, Y, SiH_4 and Si

in the X-ray energy range of 1,4 KeV - 29 KeV: Final report for the period 15 December 1988 - 14 May 1992, 18:2058 (R;XA)
Low temperature creep of copper intended for nuclear waste containers, 18:1025 (R;SE)
Magneto-optic characterizations of superlattices and wedged sandwiches with oscillatory interlayer magnetic coupling, 18:951 (R;US)
Models of high velocity impact phenomena, 18:1010 (R;US)
Nucleation and growth in electrodeposition of thin copper films on pyrolytic graphite, 18:1016 (R;US)
Reductive mobilization of oxide-bound metals: Progress report, September 15, 1991–September 15, 1992, 18:1631 (R;US)
Stability of metallic copper in the near surface environment, 18:1177 (R;SE)

COPPER ALLOYS
See also COPPER BASE ALLOYS
A first-principles study of short range order in Cu-Zn, 18:966 (R;US)

COPPER BASE ALLOYS
See also HEUSLER ALLOYS
Effect of silver addition on resistivity of copper base alloys, 18:2112 (IA;BR;In Portuguese)
Phase transformations of odontologic alloy of the Cu-Zn-Al-Ni system, 18:2113 (IA;BR;In Portuguese)

COPPER COMPOUNDS
See also COPPER OXIDES
COPPER SULFATES
CUPRATES
A study on the development of high Tc superconducting materials, 18:2227 (R;KR;In Korean)

COPPER OXIDES
Crystal Growth
Mono-crystal growth of high temperature HoBa2Cu3O7-x superconductor with four facet lattice symmetry, 18:1063 (IA;IR;In Persian)

Fluctuations
Large magnetic field induced fluctuation effect in superconducting $Bi_2Sr_2Ca_2Cu_3O_{10}$ tape, 18:1035 (R;US)

Magnetic Flux
Magnetic hysteresis and flux creep of $YBa_2Cu_3O_x$ grown by the melt-powder-melt-growth (MPMG) process, 18:1073 (R;US)
Phase equilibria, superconductivity, and flux creep in $Nd_{1+x}Ba_{2-x}Cu_3O_{7+\delta}$ superconductors, 18:1065 (R;US)

Magnetic Susceptibility
Magnetic and transport properties in the $(Nd_{1-x}Gd_x)_{1.85}Ce_{0.15}CuO_{4-}y$ system, 18:1001 (IA;BR;In Portuguese)

Nuclear Quadrupole Resonance
NQR study of local structures and cooling rate dependent superconductivity in $La_2CuO_{4+\delta}$, 18:1070 (R;US)

Phase Diagrams
Summary of phase separation, structure and superconductivity in super-oxygenated $La_2CuO_{4+\delta}$, 18:1072 (R;US)

Phase Studies
Phase equilibria, superconductivity, and flux creep in $Nd_{1+x}Ba_{2-x}Cu_3O_{7+\delta}$ superconductors, 18:1065 (R;US)

Potentiometry
Potentiometric analysis for determining copper charge and oxygen content in Cu base oxides, 18:1050 (IA;BR;In Portuguese)

Regeneration
Development of novel copper-based sorbents for hot-gas cleanup: Technical report, March 1, 1992–May 31, 1992, 18:48 (R;US)

Sorptive Properties
Development of novel copper-based sorbents for hot-gas cleanup: Technical report, March 1, 1992–May 31, 1992, 18:48 (R;US)
Proof-of-concept testing of fluidized-bed copper oxide process: Phase 4, Conceptual design and economic evaluation: Technical progress report No. 4-2, October 1991–March 1992, 18:73 (R;US)

Superconductivity
Current transport across grain boundaries in $TlBa_2Ca_2Cu_3O_x$ thick polycrystalline films and $YBa_2Cu_3O_7$ step edges, 18:1031 (R;US)
Effect of substrate-twin-induced microstructure on transport properties of epitaxial $Tl_2Ba_2CaCu_2O_x$ films in a magnetic field, 18:1032 (R;US)
Enhanced superconducting properties in $Bi_2Sr_2Ca_1Cu_2O_y$ by thermal and mechanical processing, 18:1033 (R;US)
NQR study of local structures and cooling rate dependent superconductivity in $La_2CuO_{4+\delta}$, 18:1070 (R;US)
Phase equilibria, superconductivity, and flux creep in $Nd_{1+x}Ba_{2-x}Cu_3O_{7+\delta}$ superconductors, 18:1065 (R;US)
Summary of phase separation, structure and superconductivity in super-oxygenated $La_2CuO_{4+\delta}$, 18:1072 (R;US)
Transport and magnetization critical current densities in $TlBa_2Ca_2Cu_3O_x$ tapes, 18:1071 (R;US)

X-Ray Diffraction
Magnetic and transport properties in the $(Nd_{1-x}Gd_x)_{1.85}Ce_{0.15}CuO_{4-}y$ system, 18:1001 (IA;BR;In Portuguese)

Zinc
Zinc doping effect on YBaCuO, 18:2177 (IA;BR)

COPPER SELENIDE SOLAR CELLS
Polycrystalline thin film materials and devices: Annual subcontract report, 16 January 1991–15 January 1992, 18:372 (R;US)

COPPER SULFATES
Development and application of the quasi-potential transformation, 18:1181 (R;US)

CORALS
Study by neutron activation analysis and by X-ray diffraction of ossification kinetics of coral implanted in pig cortex, 18:1142 (R;FR;In French)
Study of chemistry transformations of in vivo implanted coral by nuclear analysis methods, 18:1724 (R;FR;In French)

CORES (REACTOR)

DEXTRAN
Polysaccharides and bacterial plugging: [Quarterly report], April 1–June 30, 1992, 18:100 (R;US)

DIAGNOSIS
Biotechnology an Overview of Applications and Impact on Environment, 18:1667 (R;FR)

DIAGNOSTIC TECHNIQUES
Biomedical applications of radioactive nuclear beams, 18:1706 (R;FR)

DIAMONDS
Diamond obtainment by CVD on Si(100) substrate, 18:2151 (IA;BR;In Portuguese)
Plasma, photon, and beam synthesis of diamond films and multilayered structures: Progress report, July 1, 1990–September 1992, 18:1094 (R;US)
Thermal plasma processing of materials: Progress report, September 1, 1988–January 31, 1992, 18:1093 (R;US)

DIAPHRAGMS (THERMONUCLEAR DEVICE)
See LIMITERS

DIBORANE
See BORANES

DIELECTRIC MATERIALS
A basic study of the aging process in solid dielectric cables, Part 1: First annual report, September 29, 1977–October 31, 1978, 18:1272 (R;US)

DIELECTRIC TRACK DETECTORS
Effects of atomic hydrogen on polymeric track detectors, 18:1450 (R;SU;In Russian)

DIELECTRICS
See DIELECTRIC MATERIALS

DIESEL ENGINES
Abrasive wear by coal-fueled diesel engine and related particles, 18:943 (R;US)

DIESEL FUELS
Criteria for evaluating the health risk remaining after bioremediation of a buried mass of diesel fuel No. 2, 18:1549 (R;US)
Upgrading of raw oil into advanced fuel: Task 5, 18:23 (R;US)

DIESEL MOTORS
See DIESEL ENGINES

DIESEL OIL (FRACTION)
See DIESEL FUELS

DIFFERENTIAL CALCULUS
ADIFOR: A Fortran system for portable automatic differentiation, 18:2414 (R;US)

DIFFERENTIAL EQUATIONS
See also PARTIAL DIFFERENTIAL EQUATIONS
Preconditioned time-difference methods for solving advective-diffusive systems, 18:2485 (R;US)

Uniform convergence estimates for multigrid V-cycle algorithms with less than full elliptic regularity, 18:2418 (R;US)
DIFFRACTION (NEUTRON)
See NEUTRON DIFFRACTION
DIFFRACTION (X-RAY)
See X-RAY DIFFRACTION
DIGESTER GAS
See METHANE
DIGESTIVE SYSTEM DISEASES
Computerized tomography in neoplasia of digestive tract, 18:1696 (IA;BR;In Spanish)
DIMERS
Magnetic susceptibility of dimerized Hubbard chain, 18:2234 (IA;BR;In Portuguese)
DIODE TRANSISTORS
See TRANSISTORS
DIODES (SEMICONDUCTOR)
See SEMICONDUCTOR DIODES
DIOLS
See GLYCOLS
DIOXIN
Level of dioxin emissions and measurement techniques in Finland: A literature review, 18:1541 (R;FI;In Finnish)
DIRAC EQUATION
Equation of motion of four degree for tetranions, 18:1807 (R;SU;In Russian)
DIRECTIONAL DRILLING
Horizontal drilling in shallow, geologically complex reservoirs, 18:141 (R;US)
DIRECTIONAL RADIATION DETECTORS
Directional fast-neutron detectors, 18:1428 (R;US)
DISCHARGES (ELECTRIC)
See ELECTRIC DISCHARGES
DISINTEGRATION (BIOLOGICAL)

SHALE OIL
Rates of reaction and process design data for the Hydrocarb Process, 18:326 (R;US)
US Energy Industry Financial Developments: 1992 Second quarter (1992 Second Quarter.), 18:794 (R;US)

FOSSIL-FUEL POWER PLANTS
Advanced separation technology for flue gas cleanup: Quarterly technical report No. 1, 18:436 (R;US)
Applying environmental externalities to US Clean Coal Technologies for Taiwan, 18:795 (R;US)
Atmospheric fluidized bed combustion advanced concept system: Final report, 18:83 (R;US)
Catalytic fabric filtration for simultaneous NO_x and particulate control: Quarterly technical progress report, April 1–June 30, 1992, 18:431 (R;US)
Comprehensive report to congress Clean Coal Technology Program: Milliken Clean Coal Technology Demonstration Project, 18:428 (R;US)
Emissions of airborne toxics from coal-fired boilers: Mercury, 18:427 (R;US)
Evaluation of austenitic alloys for advanced steam cycles and hot-gas cleanup systems, 18:424 (R;US)
Fundamental mechanisms in flue gas conditioning: Quarterly report, April 1992–June 1992, 18:432 (R;US)
Interference from acid gases in relation to the measurement of dust concentrations, 18:1499 (I;DK;In Danish)
Porto Tolle thermoelectric power station and aquatic environment of Po Delta (Italy): Synthesis of data, 18:1634 (R;IT;In Italian)
Proceedings of the sixth annual conference on fossil energy materials: Fossil Energy AR and TD Mateials Program, 18:51 (R;US)
Sorption and chemical transformation of PAHs on coal fly ash: Technical progress report No. 3, May 1–July 31, 1992, 18:435 (R;US)
The release of cadmium and mercury into the Finnish environment, 18:1543 (R;FI)

FOUNDATIONS
Radiological survey results at 13 Cliff Street, Beverly, Massachusetts (VB015), 18:1576 (R;US)
Radiological survey results at 18 Cliff Street, Beverly, Massachusetts (VB012), 18:1579 (R;US)

FOUR-PI COUNTING
Study of evolution of $^{40}Ar+^{nat}Ag$ reaction from 7 to 34 MeV/u with a 4π multidetector of charged particles, 18:2039 (R;FR;In French)
The cluster counter as a part of the 4-facility at SIS/ESR, 18:1437 (RA;PL)

FOURIER TRANSFORM SPECTROMETERS
High spectral resolution measurements for the ARM Program: Year two technical progress report, March 15, 1991–March 15, 1992, 18:1485 (R;US)

FOWL
Use of mineralization kinetics to estimate the agricultural value of organic fertilizers, 18:917 (RA;FR)

FOXES
Endangered species preactivity survey and monitoring program for Western Area Power Administration's Tracy-Livermore 230-kV transmission line construction: Final report, 18:734 (R;US)

FRACTURE MECHANICS
Computer code for evaluation of creep and damage: Validation through experimental data, 18:980 (R;IT)
Hermite interpolation algorithm for 2D fracture mechanics, 18:2419 (R;US)

FRANCE
Monthly results of measurements; April 1992, 18:1589 (R;FR;In French)
Monthly results of measurements; Jun 1992, 18:1591 (R;FR;In French)
Monthly results of measurements; March 1992, 18:1588 (R;FR;In French)
Monthly results of measurements; May 1992, 18:1590 (R;FR;In French)
Pilot tests on radioactive waste disposal in underground facilities, 18:234 (R;FR)

FREE CONVECTION
See NATURAL CONVECTION

FREE ELECTRON LASERS
A proposed experiment for beam conditioning, 18:1291 (R;US)
A two-frequency Wiggler for a better control of a free-electron-laser dynamics, 18:1271 (R;FR)
Electron beam transport for the LBL IR-FEL, 18:1288 (R;US)
End effects and orbit correction in the wiggler for the ATF harmonic generation FEL, 18:1309 (R;US)
Inverse Free Electron Laser beat-wave accelerator research: Annual progress report, 18:1295 (R;US)
Lasing attempts with a microwiggler on the Los Alamos FEL, 18:1378 (R;US)
Photocathode electron linac for AFEL, 18:1298 (R;US)
Sensitivity studies of a standing-wave free-electron laser, 18:1384 (R;US)
Summary of the linac based radiation sources working group, 18:1290 (R;US)
Time-resolved electron-beam characterizations with optical transition radiation, 18:1337 (R;US)

FREEZERS
Electricity savings from implementation of standards for the electricity consumption of refr./freezers, 18:838 (R;DK)
Laboratory evaluation of an ozone-safe nonazeotropic refrigerant mixture in a Lorenz-Meutzner refrigerator freezer design, 18:837 (R;US)

FRESH WATER
The valuation of environmental goods in Norway: A contingent valuation study with multiple bias testing, 18:765 (I;NO)

FRESH WATER ECOSYSTEMS
See AQUATIC ECOSYSTEMS

FRICKE DOSEMETERS

Fuels Preparation Department monthly report, March 1961, 18:657 (R;US)
Fuels Preparation Department monthly report, March 1962, 18:665 (R;US)
Fuels Preparation Department monthly report, May 1962, 18:668 (R;US)
Fuels Preparation Department monthly report, November 1960, 18:653 (R;US)
Fuels Preparation Department monthly report, November 1962, 18:673 (R;US)
Fuels Preparation Department monthly report, October 1961, 18:662 (R;US)
Fuels Preparation Department monthly report, September 1961, 18:661 (R;US)
Fuels Preparation Department monthly report, September 1962, 18:672 (R;US)
Fuels Preparation Department monthly summary report, January 1961, 18:655 (R;US)
Fuels preparation department, monthly report, November 1961, 18:663 (R;US)
New fuel element development report of meeting, June 16, 1952, 18:169 (R;US)
New fuel element development report of meeting, June 23, 1952, 18:167 (R;US)
New fuel element development, alloy development: Trip report, BMI, June 19, 1952, 18:168 (R;US)

Friction Factor
Experimental results of drop of pressure and friction factor of preliminary tests in R.P.R. reactor fuel elements, 18:700 (IA;BR;In Portuguese)

Irradiation
Irradiation experience with HT9-clad metallic fuel, 18:516 (R;US)

Meltdown
Simulation of the CORA-13 experiment by the FRAS-SFD computer code in blind conditions, 18:591 (R;CS)

Pressure Drop
Experimental results of drop of pressure and friction factor of preliminary tests in R.P.R. reactor fuel elements, 18:700 (IA;BR;In Portuguese)

Production
Fuels Preparation Department monthly report, August 1961, 18:660 (R;US)
Fuels Preparation Department monthly report, August 1962, 18:671 (R;US)

Testing
Handling effluent from nuclear thermal propulsion system ground tests, 18:539 (R;US)

FUEL GAS
See also NATURAL GAS
A calcium oxide sorbent process for bulk separation of carbon dioxide: Annual report, September 1989–August 1990, 18:25 (R;US)
Desulfurization of hot fuel gas produced from high-chlorine Illinois coals: Technical report, March 1, 1992–May 31, 1992, 18:49 (R;US)
Development of novel copper-based sorbents for hot-gas cleanup: Technical report, March 1, 1992–May 31, 1992, 18:48 (R;US)
Effects of coal-derived trace species on performance of molten carbonate fuel cells: Final report, 18:826 (R;US)
Inventarisation of techniques for CO_2 removal from fuel gas or reformer gas, 18:50 (R;NL)
Stabilization and/or regeneration of spent sorbents from coal gasification: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:47 (R;US)

FUEL PELLETS
CFBC evaluation of fuels processed from Illinois coals: Technical report, March 1, 1992–May 31, 1992, 18:92 (R;US)

FUEL PENCILS
See FUEL PINS

FUEL PINS
Timing analysis of PWR fuel pin failures: Volume 1, Main text and Appendices A–J: Final report, 18:719 (R;US)
Timing analysis of PWR fuel pin failures: Volume 2, Appendices K–L: Final report, 18:720 (R;US)

FUEL REPROCESSING
See REPROCESSING

FUEL REPROCESSING PLANTS
See also COGEMA LA HAGUE
SELLAFIELD REPROCESSING PLANT

Analytical techniques for in-line/on-line monitoring of uranium and plutonium in process solutions : a brief literature survey, 18:184 (R;IN)

FUEL ROD CONSOLIDATION
See FUEL RODS

FUEL RODS
Comments on Oak Ridge examination of irradiated thorium, 18:171 (R;US)
Corrosion testing program at Argonne National Laboratory, 18:625 (R;US)
Development of new methods for removing ruptured slugs, 18:634 (R;US)
Presentation of the Fabrice process: validation by the Prisca experiments and refabrication experience up to 1991, 18:554 (R;FR)
Production Test 221-T-19 reduction of time cycle in dissolver section, 18:201 (R;US)
Radiographic inspection of fuel slug welds equipment and program at Hanford Works, 18:586 (R;US)
Slug failure: Decontamination experiments: W.A. Chren and W.M. Heston, ANL trip report, May 8–9, 1952, 18:706 (R;US)
Trip report - Hanford, May 12–15, 1952, 18:623 (R;US)
Trip report, Hanford, May 19–22, 1952: [Irrodiction results; uranium canning], 18:627 (R;US)
Trip report: Hanford, June 23–24, 1952, 18:172 (R;US)
Trip report: Thorium meeting, Division of Research, AEC, Washington, DC, May 7, 1952, 18:197 (R;US)

FUEL SHEATHS
See FUEL CANS

FUEL SLUGS
See FUEL RODS

FUEL SLURRIES
CFBC evaluation of fuels processed from Illinois coals: Technical report, March 1, 1992–May 31, 1992, 18:92 (R;US)
Evaluation of the Adewa process, 18:16 (RA;FI)
Gasifier feed - Tailor-made from Illinois coals: [Quarterly] report, March 1, 1992–May 31, 1992, 18:46 (R;US)

FUEL SUBSTITUTION
AMFU: Alternative motor fuel use model, 18:2421 (CM;US)
Present status and future trend of cooperation in new energy (the U.S.), 18:803 (R;JP;In Japanese)

FUEL SUSPENSIONS

G

G CODES
GEOTAB. Overview, 18:2482 (R;SE)

GADOLINIUM
Spin structures of Fe/Gd and Fe/Cr multilayers determined by polarized neutron reflectometry, 18:954 (R;US)

GADOLINIUM 157
Charge exchange of very heavy ions in carbon foils and in the residual gas of the Ganil cyclotrons, 18:2032 (R;FR)

GADOLINIUM 158
Intense two-step cascades of ^{158}Cd compound-state decay, 18:2021 (R;SU)

GADOLINIUM COMPOUNDS
Magnetic refrigeration cycle analysis using selected thermodynamic property characterizations for gadolinium gallium garnet, 18:737 (R;US)

GALLBLADDER
See BILIARY TRACT

GALLIUM
Purification of gallium by physico-chemical processes, 18:2138 (IA;BR;In Portuguese)

GALLIUM 66
Production of gallium-66, a positron emitting nuclide for radioimmunotherapy, 18:306 (R;US)

GALLIUM 67
The development of cyclotron radionuclides(II), 18:308 (R;KR;In Korean)

GALLIUM ANTIMONIDES
Strained quantum well modulation-doped InGaSb/AlGaSb structures grown by molecular beam epitaxy, 18:1119 (R;US)

GALLIUM ARSENIDES
Franz-Keldysh oscillation associated to exciton in GaAs, 18:2292 (IA;BR;In Portuguese)
Heat generation produced in thin layers of GaAs superconductors under high energy particles irradiation, 18:2186 (R;SU;In Russian)
Impurity-related optical absorption and photoluminescence spectra of GaAs-$Ga_{1-x}Al_xAs$ cylindrical quantum-well wires, 18:2281 (IA;BR)
On the acceptor-related photoluminescence spectra of GaAs quantum-wire microcrystals: A model calculation, 18:2075 (R;XA)
Optical studies on strained heterostructures of $In_xGa_{1-x}As$/GaAs and $In_xGa_{1-x}As$/GaAs/$Al_yGa_{1-y}As$, 18:1108 (IA;BR;In Portuguese)
Pressure and composition effects on gap properties of $Al_xGa_{a-x}As$, 18:2273 (IA;BR;In Portuguese)
Synthesis of GaAs by SSD (Synthesis, Solute Diffusion) technique, 18:2102 (IA;BR;In Portuguese)

GALLIUM COMPOUNDS
See also GALLIUM ANTIMONIDES
GALLIUM ARSENIDES
GALLIUM NITRIDES
Magnetic refrigeration cycle analysis using selected thermodynamic property characterizations for gadolinium gallium garnet, 18:737 (R;US)

GALLIUM NITRIDES
Crystalline growth of wurtzite GaN on (111) GaAs, 18:1074 (R;US)
GALLSTONES
See BILIARY TRACT
GAMMA DETECTION
Applying EGS4 computer code for calculating the efficiency of gamma detectors in borehole testing, 18:1412 (IA;IR;In Persian)
GAMMA RADIOGRAPHY
Ultrasonic testing X gammagraphy, 18:1263 (I;BR;In Portuguese)
GAMMA SPECTRA
RICKI: Interactive gamma spectral analysis, 18:2437 (CM;US)
TOAD: Processing of analyzer gamma-ray spectra, 18:2436 (CM;US)
GANGLIOSIDES
Radiation absorbed dose and tumor response during therapy with iodine-131 conjugated 3F8 monoclonal antibody, 18:1677 (RA;US)
GANIL
See GANIL CYCLOTRON
GANIL CYCLOTRON
Charge exchange of very heavy ions in carbon foils and in the residual gas of the Ganil cyclotrons, 18:2032 (R;FR)
Nuclear physics at Ganil. A compilation 1989-1991, 18:1986 (R;FR)
Study and implant of a new beam detector at Ganil, 18:1405 (R;FR;In French)
GARNETS
Cr(III) electron spin resonance in calcium, gallium and germanium garnet, 18:2130 (IA;BR;In Portuguese)
Magnetic refrigeration cycle analysis using selected thermodynamic property characterizations for gadolinium gallium garnet, 18:737 (R;US)
GAS COOLANTS
See GASES
GAS COOLED GRAPHITE MODERATED REACTOR
See GCR TYPE REACTORS
GAS ENGINES

GASEOUS EFFLUENTS
See GASEOUS WASTES
GASEOUS WASTES
See also FLUE GAS
Liquefaction and storage of thermal treatment off-gases, 18:260 (R;US)
Performing wind-tunnel modeling for better management of near-field risks, 18:1536 (R;US)
GASES
See also AIR
ELECTRON GAS
FUEL GAS
Adsorption of a binary gas mixture which laterally interacts on a random heterogeneous surface, 18:1179 (R;US)
Waste Isolation Pilot Plant: Alcove Gas Barrier trade-off study, 18:263 (R;US)
GASOLINE
Oil performance in a methanol-fueled vehicle used in severe short-trip service, 18:945 (R;US)
GASOLINE ENGINES
See INTERNAL COMBUSTION ENGINES
GASOLINE SERVICE STATIONS
Inventory of volatile organic compound emissions in Finland, 1985, 18:136 (R;FI)
GASTROINTESTINAL TRACT
CT of acute gastrointestinal disease, 18:1690 (IA;BR)
Computerized tomography and nuclear magnetic resonance in gastroenterology, 18:1688 (IA;BR;In Spanish)
Use of total beta counts to estimate GI tract dose rates, 18:1728 (R;US)
GAUGE INVARIANCE
Consistences for introducing more vector potentials in the same group, by BRST algorithm, 18:1867 (IA;BR;In Portuguese)
GAUGE TRANSFORMATIONS
See GAUGE INVARIANCE
GCR TYPE REACTORS
Decision aid systems for nuclear reactors, 18:464 (R;FR;In French)
GENE MUTATIONS
An immunochemical approach to the study of DNA damage and repair: Technical progress report, May 1, 1989–April 30, 1992, 18:1733 (R;US)
GENERATORS (ELECTRIC)
See ELECTRIC GENERATORS
GENERATORS (STEAM)
See STEAM GENERATORS
GENETIC MAPPING
[Development of a Human Genome Data Base]: Progress report, 18:1673 (R;US)
GENETICS
Progress report on research and development work 1991 of the Institute of Genetics and Toxicology of Fissionable Materials, Karlsruhe Nuclear Research Center, 18:1765 (R;DE;In German)
GEOLOGIC FISSURES
Fissures and boreholes plugging in fractured geologic deposits (granites), 18:235 (R;FR;In French)
GEOLOGIC FORMATIONS
Dip-moveout error in transversely isotropic media with linear velocity variation in depth, 18:1776 (R;US)
Migration error in transversely isotropic media with linear velocity variation in depth, 18:1775 (R;US)
GEOLOGIC FRACTURES
Field Tests
Aespoe hard rock laboratory. Field investigation methodology and instruments used in the preinvestigation phase, 1986-1990, 18:287 (R;SE)
Fluid Flow
Prediction of flow and drawdown for the site characterization and validation site in the Stripa mine, 18:1609 (R;SE)
Ground Water
Site characterization and validation - Head variations during the entire experimental period, 18:1617 (R;SE)
Grouting
Final report of the rock sealing project. Sealing of zones disturbed by blasting and stress release, 18:1621 (R;SE)
Theoretical investigations of grout seal longevity - Final report, 18:1178 (R;SE)
Hydraulic Conductivity
A comparison of measurements and calculations for the Stripa tracer experiments, 18:1620 (R;SE)
Characterization of nearfield rock - A basis for comparison of repository concepts, 18:1598 (R;SE)
Discrete fracture modelling of the Finnsjoen rock mass: Phase 2, 18:1599 (R;SE)
Large scale cross hole testing, 18:291 (R;SE)
Numerical groundwater flow calculations at the Finnsjoen study site - extended regional area, 18:267 (R;SE)
Rock mechanics characterization and modelling of the disturbed zone phenomena at Stripa, 18:1616 (R;SE)
Simulation of tracer transport for the site characterization and validation site in the Stripa mine, 18:1610 (R;SE)
Site characterization and validation - Final report, 18:1622 (R;SE)
Sternoe study site. Scope of activities and main results, 18:1597 (R;SE)

The Stripa project annual report 1991, 18:1623 (R;SE)
Liquid Flow
Discrete fracture modelling for the Stripa tracer validation experiment predictions, 18:1618 (R;SE)
Measuring Instruments
Aespoe hard rock laboratory. Field investigation methodology and instruments used in the preinvestigation phase, 1986-1990, 18:287 (R;SE)
Radionuclide Migration
Hydraulic gradients in rock aquifers, 18:1603 (R;SE)
Modelling tracer transport in fractured rock at Stripa, 18:1605 (R;SE)
Simulation of the migration in fracutred rock by a model based on capillary tubes, 18:1602 (R;SE)
Site characterization and validation - tracer migration experiment in the validation drift, report 1: Instrumentation site preparation and tracers, 18:1606 (R;SE)
Seismic Detection
Geomechanical behaviour of boom clay under ambient and elevated temperature conditions, 18:237 (R;FR)
Water Influx
Site characterization and validation - Inflow to the validation drift, 18:293 (R;SE)

HIGH-LEVEL RADIOACTIVE WASTES
Comments on the SKB research and development work since 1984 - an overview, 18:271 (R;SE;In Swedish)

Extraction of actinides from high level waste streams of Purex process using mixtures of CMPO and TBP in dodecane, 18:187 (R;IN)
Factors affecting the rate of hydrolysis of phenylboronic acid in lab-scale precipitate reactor studies, 18:276 (R;US)
HLW immobilization in glass: industrial operation and product quality, 18:221 (R;FR)
Inorganic analyses of volatilized and condensed species within prototypic Defense Waste Processing Facility (DWPF) canistered waste, 18:280 (R;US)
LLUVIA-II: A program for two-dimensional, transient flow through partially saturated porous media: Yucca Mountain Site Characterization Project, 18:261 (R;US)
Modelling of radionuclide migration and heat transport from an High-Level-Radioactive-Waste-repository (HLW) in Boom clay, 18:238 (R;FR)
Physical system requirements - Accept waste, 18:231 (R;US)
Pilot tests on radioactive waste disposal in underground facilities, 18:234 (R;FR)
Pretreatment process testing of Hanford tank waste for the US Department of Energy's Underground Storage Tank Integrated Demonstration, 18:257 (R;US)
Remote ignitability analysis of high level radioactive wastes, 18:275 (R;US)
Task plan for test of PRBT prototypic liquid sampler: Revision 1, 18:278 (R;US)
The corrosion kinetics of borosilicate glasses for radioactive waste disposal, 18:244 (IA;CH)

HIGH-TC SUPERCONDUCTORS
Inelastic neutron scattering study of the spin dynamics in the high temperature superconducting system $YBa_2Cu_3O_{6+x}$, 18:2100 (R;FR)

Absorption Spectra
Infrared radiation absorption in superconducting metaloxide $YBa_2Cu_3O_{7-\sigma}$, 18:2225 (R;SU;In Russian)

Critical Current
Local critical current measurements on $(Bi,Pb)_2Sr_2Ca_2Cu_3O_x$ tape with an electromagnetic probe, 18:1029 (R;US)
Progress toward application of bulk high-T_c superconductors, 18:1028 (R;US)

Crystal Lattices
Study of the modulated structure of $Bi_2(Sr,Ca)_3Cu_2O_{8+\gamma}$ in the range 8-920 K, 18:2223 (R;SU)

Electric Conductivity
Pressure study of the electrical resistivity of high T_c superconductors, 18:1058 (IA;BR)
Resistive transition in deoxygenated YBaCuO, 18:1057 (IA;BR;In Portuguese)

Fluctuations
Large magnetic field induced fluctuation effect in superconducting $Bi_2Sr_2Ca_2Cu_3O_{10}$ tape, 18:1035 (R;US)

Magnetic Flux
Processing high-$T_c$superconductors with GeV heavy ions, 18:1030 (R;US)
Simulation of vortex-line pinning by defects in the Y-Ba-Cu-O system, 18:1076 (R;US)

Magnetic Properties
Magnetic properties of electron liquids with disorder, 18:2219 (IA;IL)
Review on high-temperature superconductors: Oxides and Fullerenes, 18:2218 (IA;IL)

Magnetization
Magnetic properties of $YBa_2Cu_3O_{7-\delta}$ melt processed, 18:1060 (IA;BR;In Portuguese)
Superconducting properties of $Ba_{1-x}K_xBiO_3$, 18:1059 (IA;BR;In Portuguese)

Materials
A study on the development of high Tc superconducting materials, 18:2227 (R;KR;In Korean)

Measuring Methods
Local critical current measurements on $(Bi,Pb)_2Sr_2Ca_2Cu_3O_x$ tape with an electromagnetic probe, 18:1029 (R;US)

Physical Radiation Effects
Processing high-$T_c$superconductors with GeV heavy ions, 18:1030 (R;US)

Pressure Dependence
Pressure study of the electrical resistivity of high T_c superconductors, 18:1058 (IA;BR)

Quantum Field Theory
Field theoretical description of high-Tc superconductors: topological excitations, generalized statistics and doping, 18:2217 (IA;BR)

Superconductivity
On the ground state structure of two-dimensional Hubbard model on square lattice. Quantum melting of the Neel ordering, 18:2221 (R;SU)

Texture
Rapid texturing of high temperature superconductors from amorphous precursors, 18:1064 (R;US)

Transistors
Three-terminal devices of high-$T_c$superconductors: A status report and future challenges, 18:2228 (R;US)

HITREX-2 REACTOR
See ZERO POWER REACTORS

HO2
See HYDROPEROXY RADICALS

HODGKINS DISEASE
Hodgkin lymphoma attacking the chest: a case report, 18:1684 (IA;BR;In Portuguese)

HOISTS
Authorization request for potential non-compliance with the American Standard Safety Code for Elevators Dumbwaiters and Escalators, 18:714 (R;US)
Charging crane tests: Minutes of meeting, 18:1206 (R;US)

HOLMIUM OXIDES
Mono-crystal growth of high temperature HoBa2Cu3O7-x superconductor with four facet lattice symmetry, 18:1063 (IA;IR;In Persian)

HOLOGRAPHY
Pulsed holography for hypervelocity impact diagnostics, 18:1457 (R;US)

HORIZONTAL AXIS TURBINES
Survey on frequency responses of pressure tubes installed in a 12.5 meter rotor blade, 18:416 (R;NL)

HOT CELLS
Dismantling of cells 22, 23 and 24 for the fabrication of caesium and strontium sources at CE Saclay ORIS pilot facility, 18:315 (RA;FR)

HOT GAS CLEANUP
Advanced development of the Nested Fiber Filter: Phase 1, Evaluation of cleaning methods: Final report, 18:24 (R;US)
Evaluation of austenitic alloys for advanced steam cycles and hot-gas cleanup systems, 18:424 (R;US)

HOT PLASMA
Anomalous energy transport in hot plasmas: solar corona and Tokamak, 18:2329 (R;FR;In French)
Simulation of a coupled dynamic system of temperature and density in a fusion plasma, 18:2309 (R;SE)

HOT WATER HEATERS
See WATER HEATERS

HOT WIRE ANEMOMETERS
Selection of an anemometer for the measurement of wind turbulence, 18:417 (R;NL)

HOUSEHOLDS
Change in energy consumption and the stage in the family life cycle, 18:844 (R;FI;In Finnish)
Electric power savings in the housing sector: Analysis of a 3-year experiment, 18:840 (R;DK;In Danish)

HOUSES
Cooperative housing association Vaarst Vestervang: Preliminary investigations on renewable energy system for sixteen households within a cooperative housing association and experiences gained from the construction phase, 18:856 (I;DK;In Danish)
Energy performance and installation considerations for retrofitted exterior masonry wall insulation: Draft, 18:833 (R;US)

Establish feasibility for providing passive cooling with solar updraft and evaporative downdraft chimneys: Final report, June 15, 1984–December 31, 1987, 18:380 (R;US)

HTGR TYPE REACTORS
Studies on transferring the safety features of the module reactor to a large power reactor, 18:493 (R;DE;In German)

HTO

HVAC SYSTEMS
Dwellings located close to high-voltage systems and the risk of cancer development in children: Background paper, 18:731 (I;DK;In Danish)
Possibilities and expectations for improved man-machine interface in power system control, 18:727 (R;IT)

HYBRID SYSTEMS
Advanced hybrid nuclear propulsion Mars mission performance enhancement, 18:537 (R;US)

HYDRAULIC CONDUCTIVITY
A comparison of measurements and calculations for the Stripa validation drift inflow experiment, 18:1611 (R;SE)
Final report of the rock sealing project - Sealing of the near-field rock around deposition holes by use of bentonite grouts, 18:1604 (R;SE)
Fully-coupled hydro-mechanical modelling of the D-holes and validation drift inflow, 18:1615 (R;SE)
Simulation of the migration in fracutred rock by a model based on capillary tubes, 18:1602 (R;SE)
Site characterization and validation - Tracer migration experiment in the validation drift, report 2, part 1: performed experiments, results and evaluation, 18:1607 (R;SE)
Statistical inference and comparison of stochastic models for the hydraulic conductivity at the Finnsjoen-site, 18:1600 (R;SE)

HYDRAULIC EQUIPMENT
Operation of the thermohydraulics measures laboratory, 18:1247 (IA;BR;In Portuguese)
Siphon breaker design requirements: Progress report, 18:1233 (R;US)

HYDRAULIC RAMS
See PUMPS

HYDRAULIC TURBINES
Power generating apparatus for converting a potential energy to a power output, 18:362 (PA;CA)
System for hydraulically generating mechanical energy, 18:363 (PA;CA)

HYDRAZINE
Morphological aspects of surface reactions: Progress report, September 1991–August 1992, 18:1154 (R;US)

HYDRIDES
See also BORANES
RHODIUM HYDRIDES
SILANES
YTTRIUM HYDRIDES
ZIRCONIUM HYDRIDES
Stress-induced reorientation of hydride precipitates in Zr-2.5Nb-0.5Cu garter springs under complex loading, 18:500 (R;IN)

HYDROCARBONS
See also ALKANES
POLYCYCLIC AROMATIC HYDROCARBONS
TOLUENE
Coadsorption of oxygen with hydrocarbons on Pd(111) studied by low energy electron diffraction and spectroscopy, 18:1002 (IA;BR;In Portuguese)
Normal paraffin adsorptive separation using non-normal hydrocarbon pre-pulse stream, 18:115 (PA;CA)
The contribution of electronically excited states to the radiation chemistry of organic systems: Progress report, January 1, 1991–April 30, 1992, 18:1186 (R;US)
Thermal cracking of hydrocarbon mixtures at high pressure: experimental kinetic study and numerical modeling, implications for petroleum geochemistry, 18:112 (R;FR;In French)

HYDROCHLORIC ACID
Behavior of sulfur and chlorine in coal during combustion and boiler corrosion: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:91 (R;US)

HYDROCRACKING
Petroleum hydrocracking face to face Molybdenum based dispersed catalyst, 18:114 (R;FR;In French)

HYDROCYANIC ACID
Modelling electric discharge chemistry, 18:1145 (R;CA)

HYDRODYNAMICS
Impact modeling with Smooth Particle Hydrodynamics, 18:1214 (R;US)

HYDROFLUORIC ACID
Development and validation of atmospheric dispersion models for ideal gases and hydrogen fluoride: Part 1, Technical reference manual, 18:1492 (R;US)

HYDROGEN

Adsorption
Study on indirect interaction between adsorbed atoms, 18:2069 (IA;BR;In Portuguese)

Antimatter
Production of relativistic anti-hydrogen atoms by pair production with positron capture and measurement of the Lamb shift, 18:2089 (R;US)

Catalysts
The reaction between H_2 and O_2 over tungsten carbide catalysts, 18:560 (RA;FR)

Chemical Reactions
Analysis of forward and inverse problems in chemical dynamics and spectroscopy, 18:1172 (RA;US)

Combustion
A simplified analysis of the effect of hydrogen generation following a beyond design basis accident in an Indian PHWR, 18:504 (RA;FR)
EPRI research on hydrogen combustion and control, 18:456 (RA;FR)
Hydrogen in water-cooled nuclear power reactors, 18:444 (R;FR)
Proving test on the reliability for reactor containment vessel (2) hydrogen burning test, 18:454 (RA;FR)

Combustion Kinetics
Experimental results and modelling strategies for multi-compartment hydrogen deflagration, 18:450 (RA;FR)
Proving test on the reliability for reactor containment vessel (2) hydrogen burning test, 18:454 (RA;FR)
The reaction between H_2 and O_2 over tungsten carbide catalysts, 18:560 (RA;FR)
Two models of hydrogen combustion in a closed cylinder, 18:451 (RA;FR)

Computer Codes
Results of the PHDR computational Benchmark exercises on hydrogen distribution experiments E11.2 and E11.4, 18:449 (RA;FR)

Containment Mockup Facility
Proving test on the reliability for reactor containment vessel hydrogen mixing and distribution test, 18:471 (RA;FR)

Deposition
Hydrogenated germanium and silicon amorphous alloys (a-$Si_{1-x}Ge_x$:H), 18:1000 (IA;BR;In Portuguese)
Influence of deposition conditions on Si:H-a films obtained by cathodic pulverization, 18:1107 (IA;BR;In Portuguese)

Detection
Hydrogen mitigation technical means of nuclear power plants, 18:473 (RA;FR)

Detonation Waves
Calculation of the pressure transient due to hydrogen deflagration in closed and vented volumes, 18:503 (RA;FR)
Criteria for transition to detonation for hydrogen flames, 18:452 (RA;FR)
Experimental results and modelling strategies for multi-compartment hydrogen deflagration, 18:450 (RA;FR)
Hydrogen risk: studies about detonation phenomena via Plexus code, 18:556 (RA;FR)

Diffusion
Determination of hydrogen evolution in a-Si:H, a-C:H and a-SiC:H thin films, 18:2070 (IA;BR;In Portuguese)

Distribution
Proving test on the reliability for reactor containment vessel hydrogen mixing and distribution test, 18:471 (RA;FR)
Results of the PHDR computational Benchmark exercises on hydrogen distribution experiments E11.2 and E11.4, 18:449 (RA;FR)
Three dimensional numerical simulation of hydrogen distribution and mixing in containment, 18:448 (RA;FR)
Use of the Jericho code for the assessment of thermalhydraulics and hydrogen behaviour in nuclear power plant containment, 18:472 (RA;FR)

Electron-Atom Collisions
Excitation of atomic hydrogen, 18:2081 (R;XA)

Excitation
Excitation of atomic hydrogen, 18:2081 (R;XA)

Flames
Criteria for transition to detonation for hydrogen flames, 18:452 (RA;FR)
EPRI research on hydrogen combustion and control, 18:456 (RA;FR)

Gas Flow
Experimental results of the large-scale HDR hydrogen-mixing experiments E11.2 and E11.4, 18:469 (RA;FR)

H Codes
A simplified analysis of the effect of hydrogen generation following a beyond design basis accident in an Indian PHWR, 18:504 (RA;FR)

Humidity
Experimental results of the large-scale HDR hydrogen-mixing experiments E11.2 and E11.4, 18:469 (RA;FR)

Hydrogen Burning
Use of the Jericho code for the assessment of thermalhydraulics and hydrogen behaviour in nuclear power plant containment, 18:472 (RA;FR)

Ignition Systems
Critical review on hydrogen mitigation by ignitors for large dry PWR containments, 18:475 (RA;FR)

Ion Probes
Electrochemical devices for hydrogen concentration and pH measurements in the coolant of water-cooled reactors, 18:455 (RA;FR)

J Codes
Use of the Jericho code for the assessment of thermalhydraulics and hydrogen behaviour in nuclear power plant containment, 18:472 (RA;FR)

M Codes
Hydrogen production limits under PWR degraded core conditions: the status of current modelling capabilities and plant predictions, 18:468 (RA;FR)

Mass
Hydrogen behaviour in VVER - 440 nuclear power plants in case of severe accidents, 18:478 (RA;FR)

Mitigation
Concept and qualification of a combined system for hydrogen mitigation after severe accidents, 18:559 (RA;FR)
Critical review on hydrogen mitigation by ignitors for large dry PWR containments, 18:475 (RA;FR)
Hydrogen in water-cooled nuclear power reactors, 18:444 (R;FR)
Hydrogen mitigation technical means of nuclear power plants, 18:473 (RA;FR)
Hydrogen mitigation using catalyst modules, 18:561 (RA;FR)
Mitigation of hydrogen threats to large dry containments (German approach), 18:474 (RA;FR)

Mixtures
Catalytic recombination systems for severe accidents and noised-induced ignition to detonation transition effect, 18:476 (RA;FR)
Catalytic removal of hydrogen in humid, hydrogen-air gas streams, 18:563 (RA;FR)
Deflagration tests of an air-hydrogen-steam mixture with not uniformly distributed steam, 18:557 (RA;FR)
EPRI research on hydrogen combustion and control, 18:456 (RA;FR)
Flame acceleration in hydrogen/air/steam mixtures in the presence of repeated obstacles in a closed volume, 18:558 (RA;FR)
Removal of hydrogen with catalytic recombiners during severe accident situations, 18:562 (RA;FR)
Some aspects of hydrogen catalytic recombiner operation under severe accident conditions, 18:477 (RA;FR)

Oxidation
Catalytic removal of hydrogen in humid, hydrogen-air gas streams, 18:563 (RA;FR)

Quantity Ratio
Hydrogen distribution experiments for Loviisa ice condenser containment, 18:470 (RA;FR)

R Codes
Hydrogen generation during reflooding of degraded core as an accident management measure, 18:446 (RA;FR)
Hydrogen production limits under PWR degraded core conditions: the status of current modelling capabilities and plant predictions, 18:468 (RA;FR)

Recombination
Catalytic recombination systems for severe accidents and noised-induced ignition to detonation transition effect, 18:476 (RA;FR)
Removal of hydrogen with catalytic recombiners during severe accident situations, 18:562 (RA;FR)
Some aspects of hydrogen catalytic recombiner operation under severe accident conditions, 18:477 (RA;FR)

Recombiners
Hydrogen mitigation technical means of nuclear power plants, 18:473 (RA;FR)

Recycling
Recycling hydrogen and sulfur by microwave chemical processing, 18:879 (R;US)

Risk Assessment
A strategy for hydrogen risks in WWER nuclear power plants, 18:479 (RA;FR)

Source Terms
Critical review on hydrogen mitigation by ignitors for large dry PWR containments, 18:475 (RA;FR)
Hydrogen in water-cooled nuclear power reactors, 18:444 (R;FR)

Stratification
Experimental results of the large-scale HDR hydrogen-mixing experiments E11.2 and E11.4, 18:469 (RA;FR)

T Codes
Three dimensional numerical simulation of hydrogen distribution and mixing in containment, 18:448 (RA;FR)

Time Dependence
Hydrogen behaviour in VVER - 440 nuclear power plants in case of severe accidents, 18:478 (RA;FR)

Vibrational States
Analysis of forward and inverse problems in chemical dynamics and spectroscopy, 18:1172 (RA;US)

HYDROGEN 1
Spin diffusion and spin-lattice relaxation of ^{1}H in polymer in the presence of small metallic aggregation, 18:2121 (IA;BR;In Portuguese)

HYDROGEN 1 TARGET
The study of reactions with deuteron and pions in the final state by np- and dp-interactions comparison, 18:2040 (R;SU)
Total breakup of ^{3}He and ^{4}He nuclei in interactions with protons, 18:2043 (R;SU;In Russian)

HYDROGEN 2

TRIGA-3-SEOUL REACTOR

Building Materials
Preliminary investigation about the structural materials effects on reactivity and irradiation chamber thermal flux of the 5 MW, 4,3% enriched uranium R.P.R. reactor, 18:686 (IA;BR;In Portuguese)

Burnup
R.P.R. burnup calculation: first phase, 18:677 (IA;BR;In Portuguese)

Computerized Simulation
Heat dynamic in the primary circuit of the R.P.R. reactor, 18:691 (IA;BR;In Portuguese)

Control Elements
Calculation of the R.P.R. reactor control rods: current status and alternatives, 18:600 (IA;BR;In Portuguese)
Results for R.P.R. reactor control rods (B_4 C-AL), 18:602 (IA;BR;In Portuguese)
Study on In-Cd-Ag control bars positioning and efficacy in the R.P.R. reactor core, 18:601 (IA;BR;In Portuguese)

Epithermal Neutrons
Results for R.P.R. reactor control rods (B_4 C-AL), 18:602 (IA;BR;In Portuguese)

Fission Products
Shielding calculation for fission products radiation levels in the R.P.R. reactor after the shutdown, 18:681 (IA;BR;In Portuguese)

Fuel Elements
Experimental results of drop of pressure and friction factor of preliminary tests in R.P.R. reactor fuel elements, 18:700 (IA;BR;In Portuguese)
Neutronic analysis of the new fuel element without graphite as vertical reflector in the rods, 18:603 (IA;BR;In Portuguese)

Natural Convection
Analytical model and complementary experiences for natural convection in the R.P.R. reactor, 18:694 (IA;BR;In Portuguese)
Heat removal by natural convection in a R.P.R. reactor, 18:697 (IA;BR;In Portuguese)

Neutron Flux
Experiments to increase the thermal neutron flux in the R.P.R. reactor central channel, 18:675 (IA;BR;In Portuguese)
Neutronic study of 5 MW R.P.R. reactor without central chamber, 18:680 (IA;BR;In Portuguese)
Preliminary investigation about the structural materials effects on reactivity and irradiation chamber thermal flux of the 5 MW, 4,3% enriched uranium R.P.R. reactor, 18:686 (IA;BR;In Portuguese)

Neutron Reflectors
Neutronic analysis of the new fuel element without graphite as vertical reflector in the rods, 18:603 (IA;BR;In Portuguese)

Neutron Spectra
Reliability study on calculation methods applied to the R.P.R. reactor, 18:682 (IA;BR;In Portuguese)

Pool Type Reactors
Boundary conditions for natural convection analysis in the R.P.R. reactor pool, 18:701 (IA;BR;In Portuguese)

Pressure Drop
Test section for the determination of loss of pressure in the radioisotope production reactor fuel elements, 18:689 (IA;BR;In Portuguese)

Reactivity
Preliminary investigation about the structural materials effects on reactivity and irradiation chamber thermal flux of the 5 MW, 4,3% enriched uranium R.P.R. reactor, 18:686 (IA;BR;In Portuguese)

Reactor Cells
Reliability study on calculation methods applied to the R.P.R. reactor, 18:682 (IA;BR;In Portuguese)

Reactor Channels
Experiments to increase the thermal neutron flux in the R.P.R. reactor central channel, 18:675 (IA;BR;In Portuguese)
Preliminary report about the R.P.R. reactor without central chamber, 18:676 (IA;BR;In Portuguese)

Reactor Fueling
Optimization study of the R.P.R. reactor with 4.3% enriched fuel, 18:683 (IA;BR;In Portuguese)

S Codes
Shielding calculation for fission products radiation levels in the R.P.R. reactor after the shutdown, 18:681 (IA;BR;In Portuguese)

Stacks
Definition of height and dimensions of stack of R.P.R. reactor building, 18:693 (IA;BR;In Portuguese)
Thermal Neutrons
Neutronic study of 5 MW R.P.R. reactor without central chamber, 18:680 (IA;BR;In Portuguese)

KRYPTON
The thermodynamic and structural contributions to the vacancy formation energies in hot rare gas solids, 18:2091 (R;XA)

KRYPTON 85
The Cambric migration experiment: A summary report, 18:1573 (R;US)

KRYPTON 86
Charge exchange of very heavy ions in carbon foils and in the residual gas of the Ganil cyclotrons, 18:2032 (R;FR)

KRYPTON FLUORIDE LASERS
Mercury: A second-generation KrF laser for inertial fusion research, 18:2387 (R;US)

L

L CODES
LASLXSECSETS: Sn 18- 24- and 25-group sets, 18:2428 (CM;US)
LAYFLO: Radionuclide transport geologic medium, 18:2430 (CM;US)

L REACTOR
Moderator studies, 18:616 (R;US)

LA REINA REACTOR
See RESEARCH REACTORS

LABELLED COMPOUNDS
See also RADIOPHARMACEUTICALS
Studies on the preparation of labelled compounds for γ-scintigraphy use, 18:1198 (R;KR;In Korean)

LABORATORIES
Development and utilization of computer programs to the nuclear measures laboratory, 18:2456 (IA;BR;In Portuguese)
Hanford Laboratories operation monthly activities report, February 1958, 18:2396 (R;US)
Operation of thermohydraulic measures laboratory, 18:1243 (IA;BR;In Portuguese)
LABYRINTH
See AUDITORY ORGANS
LACTIC ACID
Separation of compounds with multiple -OH groups from dilute aqueous solutions via complexation with organoboronate, 18:1141 (R;US)
LAKES
Long-term trends in river flow in Finland, 18:1522 (RA;FI)
LAND FILLS
See SANITARY LANDFILLS
LAND POLLUTION
Test field water/soil. Sub-project II: Pollutant transport in underground strata, methods of detection and monitoring. 1. Project phase. Final report, 18:1640 (R;DE;In German)
LAND TRANSPORT
Traffic at Louisiana: Contributions to the conference, 18:1770 (I;DK;In Danish, Swedish, Norwegian)
LANDAU-ZENER FORMULA
Fermi correlations in the Landau-Zener dynamics, 18:1880 (IA;IL)
LANDFILLS
See SANITARY LANDFILLS
LANGMUIR OSCILLATIONS
See PLASMA WAVES
LANL
Atlas of the breeding birds of Los Alamos County, New Mexico, 18:1572 (R;US)
LANTHANIDES
See RARE EARTHS
LANTHANUM 139 REACTIONS
Deexcitation processes in nuclear reactions: Annual progress report, 18:2030 (R;US)
LANTHANUM CHROMITES
See LANTHANUM OXIDES
LANTHANUM COMPOUNDS
See also LANTHANUM OXIDES
A dynamical model of structural phase transition in La_2CuO_4, 18:1066 (R;SU)
LANTHANUM OXIDES
NQR study of local structures and cooling rate dependent superconductivity in $La_2CuO_{4+\delta}$, 18:1070 (R;US)
Summary of phase separation, structure and superconductivity in super-oxygenated $La_2CuO_{4+\delta}$, 18:1072 (R;US)
LARGE INTESTINE
Colon neoplasm, 18:1693 (IA;BR;In Spanish)
LASER ISOTOPE SEPARATION
Observation of two photon absorption by optogalvanic detection in a bulb of uranium hollow cathode, 18:156 (IA;BR;In Portuguese)
LASER MIRRORS
Evaluation of environmentally safe cleaning agents for diamond turned optics, 18:1456 (R;US)
LASER RADIATION
Modification of earth-satellite orbits using medium-energy pulsed lasers, 18:1216 (R;US)
LASER TARGETS
Preparation of microcellular foam in cylindrical metal targets, 18:2386 (R;US)
LASERS
See also FREE ELECTRON LASERS
Development of nuclear fuel. Development of laser spectroscopic technology in nuclear industry, 18:157 (R;KR;In Korean)
LATEX
Study on transport properties in latex doped with iodine, 18:1101 (IA;BR;In Portuguese)
LATTICE DEFECTS
See CRYSTAL DEFECTS
LATTICE FIELD THEORY
Research in elementary particle physics: Progress report, March 1, 1992–February 28, 1993, 18:1845 (R;US)
Theoretical particle physics: Progress report, FY 1992, 18:1899 (R;US)
LATTICES (CRYSTAL)
See CRYSTAL LATTICES
LAYERS
Co/Pd multilayers: preparation and characterization by RX, 18:2154 (IA;BR;In Portuguese)
Dynamics study on resistivity of Fe/FeN multilayers, 18:2145 (IA;BR;In Portuguese)
Formation of the initial layer of iron nitrides in ion nitridation by CEMS and CXMS, 18:2096 (IA;BR;In Portuguese)
Theoretical and experimental methods for in situ infrared spectroelectrochemistry of organic monomolecular films, 18:1168 (R;US)
Theory on monolayer magnetic properties of transition metals at finite temperature, 18:2269 (IA;BR;In Portuguese)
LEACHATES
R7T7 glass alteration in the presence of mortar: effect of the cement grade, 18:1083 (R;FR)
The use of FBC wastes in the reclamation of coal slurry solids: Technical report, March 1, 1992–May 31, 1992, 18:93 (R;US)
LEACHING
Early phyllosilicates formed by alteration of R7T7 glass in water at 250 deg C, 18:1079 (R;FR)
Effect of surface finish on nuclear glass dissolution rate, 18:1081 (R;FR)
Experimental alteration of R7T7 glass in salt brines at 90 deg C and 150 deg C, 18:1080 (R;FR)
LEAD
Effect of ion implantation on the corrosion behavior of lead and lead-antimony alloy, 18:741 (R;US)
Investigation of tungsten and lead structural materials activation by 1.0-1.1 GeV protons, 18:1005 (R;SU)
Reductive mobilization of oxide-bound metals: Progress report, September 15, 1991–September 15, 1992, 18:1631 (R;US)
Studies of infiltration and lead-soil interactions at the Radioactive Waste Management Site in Area 5 of the Nevada Test Site, 18:227 (R;US)
LEAD 197
Oblate collectivity in $^{197,198}Pb$, 18:2013 (R;US)
LEAD 198
Oblate collectivity in $^{197,198}Pb$, 18:2013 (R;US)
LEAD 208
Charge exchange of very heavy ions in carbon foils and in the residual gas of the Ganil cyclotrons, 18:2032 (R;FR)
LEAD 214
The probabilistic risk assessment due to indoor exposure to ^{222}Rn daughters in Korea, 18:1755 (R;KR;In Korean)
LEAD ALLOYS
See also LEAD BASE ALLOYS
Orientational phase transitions in alloys, 18:955 (R;US)
The effect of low Au concentrations on the properties of eutectic Sn/Pb, 18:1015 (R;US)
LEAD BASE ALLOYS
Effect of ion implantation on the corrosion behavior of lead and lead-antimony alloy, 18:741 (R;US)
LEAD ZIRCONITE TITANATE
See PZT
LEAD-ACID BATTERIES
Effect of ion implantation on the corrosion behavior of lead and lead-antimony alloy, 18:741 (R;US)
LEAVES
Reflection spectra of leaves and needles as basis for the physiological evaluation of tree damage, 18:1766 (R;DE;In German)
LEGUMINOSAE
Nitrogen availability as a control mechanism of secondary succession within a semiarid shrubland ecosystem: Final report, October 1, 1990–June 27, 1992, 18:1559 (R;US)
LEP STORAGE RINGS
Heavy quark production and decay at LEP, 18:1952 (R;FR;In French)

LEPTON REACTIONS
See also ELECTRON REACTIONS
MUON REACTIONS
Theory of deep-inelastic scattering reactions and x-rescaling model, 18:2033 (R;XA)
LEPTON-DEUTERON INTERACTIONS

ORDER-DISORDER TRANSFORMATIONS
Operator ordering and symbol representations of enveloping algebras, 18:1893 (R;SU)

ORE ENRICHMENT
Quantitative analysis and automation of CaF_2 ore flotation via neutronic activation, 18:313 (RA;FR)

ORE PROCESSING
See also ORE ENRICHMENT
Summary reports of the R and D programme: primary raw materials (1986-89) - Volume III, 18:2403 (R;FR)

ORGANIC CHLORINE COMPOUNDS
See also CHLORINATED ALIPHATIC HYDROCARBONS
CHLORINATED AROMATIC HYDROCARBONS
CHLOROFLUOROCARBONS
Chlorinated hydrocarbons and PCBs in field soils, sediments and sewage sludges, 18:132 (RA;FR)
Second workshop of participants in the Joint FAO-IOC-WHO-IAEA-UNEP project on monitoring of pollution in the marine environment of the West and Central African Region (WACAF/2 - first phase), 18:134 (R;XU)

ORGANIC COMPOUNDS
See also ALDEHYDES
AMINES
AROMATICS
HYDROCARBONS
ORGANIC NITROGEN COMPOUNDS
ORGANIC POLYMERS
ORGANIC SILICON COMPOUNDS
ORGÁNIC SULFUR COMPOUNDS
PROTEINS
Inventory of volatile organic compound emissions in Finland, 1985, 18:136 (R;FI)

ORGANIC INSULATORS
Materials performances in composite insulators during aging, 18:729 (R;IT)

ORGANIC ION EXCHANGERS
Development of test methods for quality control of LLW and MLW in cement or polymers (Parts 1 and 2). Task 3. Characterization of radioactive waste forms. A series of final reports (1985-1989) no. 39, 18:236 (R;FR)
Studies on resin degradation products encountered during purification of plutonium by anion exchange, 18:185 (R;IN)

ORGANIC MATTER
See also KEROGEN
PEAT
Phosphates and blackshales of the Oulab Abdoun and Timahdit basins (Morocco): Petrography, mineralogy, geochemistry and depositional environment, 18:149 (R;FR;In French)
Utilization, cycling and vertical transport of particulate organic matter in the coastal marine environment: Final project report, November 15, 1987–May 14, 1992, 18:1630 (R;US)

ORGANIC NITROGEN COMPOUNDS
See also AMIDES
OXIMES
PORPHYRINS
Analysis of organic sulfur and nitrogen in coal via tandem degradation methods: [Quarterly] technical report, 1 March–31 May 1992, 18:65 (R;US)
[National Institute for Petroleum and Energy Research] quarterly technical report, April 1–June 30, 1992: Volume 1, Fuels research, 18:138 (R;US)

ORGANIC POLYMERS
See also BAKELITE
POLYAMIDES
POLYESTERS
POLYETHYLENE GLYCOLS
RESINS
Effects induced by ion bombardment on chemical structure and optical properties of PPS (poly paraphenylene sulfide), 18:2114 (IA;BR;In Portuguese)
New projectiles: multicharged metal clusters and biopolymers, 18:1816 (R;FR;In French)
Spin dependent recombination in conjugated polymers: An optically detected magnetic resonance study, 18:1111 (R;US)

ORGANIC SILICON COMPOUNDS
See also SILANES
SILOXANES
Interaction in polysilazane/SiC powder systems, 18:1077 (R;US)

ORGANIC SULFUR COMPOUNDS
See also THIONAPHTHENES
Analysis of organic sulfur and nitrogen in coal via tandem degradation methods: [Quarterly] technical report, 1 March–31 May 1992, 18:65 (R;US)
Mass spectral study of organic sulfur in the polymeric matrix of coal: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:63 (R;US)
Mild pyrolysis of selectively oxidized coals: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:41 (R;US)
Protocols for the selective cleavage of carbon-sulfur bonds in coal: Technical report, March 1, 1992–May 30, 1992, 18:44 (R;US)
Rate enhancement for catalytic upgrading coal naphthas: Quarterly project report, January–March 1992, 18:38 (R;US)
Vhf EPR analysis of organic sulfur in coal: [Quarterly] technical report, March 1, 1992–May 31, 1992, 18:64 (R;US)

ORGANIC WASTES
See also AGRICULTURAL WASTES
COMPOST
Anaerobic digestion of combined waste, 18:335 (IA;DK)
Source separation and collection system for biological waste collected from households, 18:323 (IA;DK)
The anaerobic option for solid waste processing, 18:332 (IA;DK)

ORNL
Carbon Dioxide Information Analysis Center: FY 1991 activities, 18:1500 (R;US)
Oak Ridge National Laboratory Review: Volume 25, No. 1, 1992, 18:1675 (R;US)

ORSAY LINAC
Linear Accelerator Laboratory -Progress report 1990-1991, 18:1840 (R;FR;In French)

ORSAY TANDEM ACCELERATOR
Equipment and working of gas circuit for the 'Empereur' tandem isolation, by sulfur hexafluoride, 18:1362 (R;FR;In French)

OSCILLATIONS (PLASMA)
See PLASMA WAVES

OSMIUM 182
The 'mystery' of the K=I=25 isomers in $_{182}$Os, 18:2017 (IA;IL)

OXIDANTS
See OXIDIZERS

OXIDASES
See OXIDOREDUCTASES

OXIDATION
See also COMBUSTION
Catalytic removal of hydrogen in humid, hydrogen-air gas streams, 18:563 (RA;FR)

OXIDIZERS
Slug failure: Decontamination experiments: W.A. Chren and W.M. Heston, ANL trip report, May 8–9, 1952, 18:706 (R;US)

OXIDIZING AGENTS
See OXIDIZERS

OXIDOREDUCTASES
See also HYDROGENASES
SUPEROXIDE DISMUTASE
Molecular biology and genetics of the acetate-utilizing methanogenic bacteria: Progress report, [July 1, 1988–June 30, 1991], 18:327 (R;US)

OXIMES
Production of lyophilized kits for labelling d,1-HMPAO with technetium-99m, 18:1195 (IA;BR;In Portuguese, English)
Synthesis and isolation of d,1-HMPAO for preparation of radiopharmaceutical with technetium 99m for medical use, 18:1194 (IA;BR;In Portuguese)

OXIRANS
See EPOXIDES

OXYGEN
Analysis of forward and inverse problems in chemical dynamics and spectroscopy, 18:1172 (RA;US)
Coadsorption of oxygen with hydrocarbons on Pd(111) studied by low energy electron diffraction and spectroscopy, 18:1002 (IA;BR;In Portuguese)
Resonance electron scattering by adsorbed molecules: σ^* resonance energy versus bond length, 18:1150 (R;US)

OXYGEN EFFECT (RADIOBIOLOGY)
See OXYGEN

OXYGEN HYDRIDES
See WATER

OZONE
Reaction dynamics and photochemistry of divalent systems, 18:2084 (R;US)
Slug failure: Decontamination experiments: W.A. Chren and W.M. Heston, ANL trip report, May 8–9, 1952, 18:706 (R;US)

1,2,3-PROPANETRIOL
See GLYCEROL

1,2-ETHANEDIOL
See GLYCOLS

P

P INVARIANCE
Measuring parity nonconservation in elastic scattering of polarized electrons from carbon 12 nuclei, 18:2036 (IA;IR;In Persian)

P REACTOR
Effect of CO_2 pD control on area activity levels, 18:617 (R;US)
Moderator studies, 18:616 (R;US)

P-N JUNCTIONS
Semi-empirical modelization of charge funneling in a NP diode, 18:1445 (R;FR;In French)

PACIFIC NORTHWEST LABORATORIES
See BATTELLE PACIFIC NORTHWEST LABORATORIES

PACIFIC OCEAN
Utilization, cycling and vertical transport of particulate organic matter in the coastal marine environment: Final project report, November 15, 1987–May 14, 1992, 18:1630 (R;US)

PACKAGING
An evaluation of Department of Transportation specification packages, 18:215 (R;US)
PAH
See POLYCYCLIC AROMATIC HYDROCARBONS
PAIR PRODUCTION
Pair production in a strong electric field, 18:1911 (IA;IL)
PAIRING INTERACTIONS
Superconductivity and spin-polaron pair model, 18:2211 (IA;BR;In Portuguese)
PALLADIUM
Coadsorption of oxygen with hydrocarbons on Pd(111) studied by low energy electron diffraction and spectroscopy, 18:1002 (IA;BR;In Portuguese)
Near-field solubility studies, 18:248 (R;GB)
Study of mechanical behavior and internal structure of ferritic nanocrystalline material: Technical progress report, 1 August 1991–1 August 1992, 18:973 (R;US)
Thermal and electric properties of laminated and hydrogenous palladium, 18:992 (IA;BR;In Portuguese)
PALLADIUM ALLOYS
Energy shift in gold-palladium alloys investigated by XPS and XAES, 18:991 (IA;BR;In Portuguese)
The direct Monte Carlo method for calculating alloy phases, 18:967 (R;US)
PALLADIUM OXIDES
Energetics, bonding mechanism and electronic structure of metal/ceramic interfaces: Annual progress report, April 1, 1992–March 31, 1993, 18:1038 (R;US)
PANCREAS
Diagnostic and interventional CT of acute pancreatic inflammation, 18:1689 (IA;BR)
PAPER
Thermal coating development for impulse drying, 18:895 (R;US)
PAPER INDUSTRY
Thermal coating development for impulse drying, 18:895 (R;US)
PARABOLIC DISH COLLECTORS
Wind load design methods for ground-based heliostats and parabolic dish collectors, 18:388 (R;US)
PARABOLIC POINT COLLECTORS
See PARABOLIC DISH COLLECTORS
PARABOLIC TROUGH REFLECTORS
Ambient radiant energy concentrator, 18:389 (PA;CA)
PARAFFINS
See ALKANES
PARAGENES
See PLASMIDS
PARALLEL PROCESSING
An improved spectral graph partitioning algorithm for mapping parallel computations, 18:2478 (R;US)
CPS: FNAL cooperative processes software tools, 18:2450 (CM;US)
Parallel encoders for pixel detectors, 18:1419 (R;SU)
The 1992 MPCI yearly report: Harnessing the killer micros, 18:2483 (R;US)
PARAMAGNETIC RESONANCE (ELECTRON)
See ELECTRON SPIN RESONANCE
PARAMETRIC INSTABILITIES
Effect of induced spatial incoherence on parametric instabilities, 18:2353 (R;FR;In French)
PARASITIC DISEASES
Contribution of the image methods in the study of Chagas disease, 18:1683 (IA;BR;In Portuguese, English)
PARASYMPATHETIC NERVOUS SYSTEM
See AUTONOMIC NERVOUS SYSTEM
PARASYMPATHOLYTICS
New techniques for positron emission tomography in the study of human neurological disorders: Progress report, 15 June 1992–31 October 1992, 18:1679 (R;US)
PARITY NONCONSERVATION
See P INVARIANCE
PARTHENOGENESIS
See REPRODUCTION
PARTIAL DIFFERENTIAL EQUATIONS
See also MAXWELL EQUATIONS
Domain decomposition as a mechanism for using asymptotic methods, 18:2415 (R;US)
Domain decomposition: A blowup problem and the Ginzburg–Landu equations, 18:2194 (R;US)
PARTICLE BEAMS
An autonomous microprocessor system for measurement of betatron oscillation parameters using signal processor, 18:1372 (R;SU;In Russian)
PARTICLE BOOSTERS
Pressure measurements in the AGS Booster ultra-high vacuum system, 18:1344 (R;US)
PARTICLE DISCRIMINATION
Optical discriminator study for the research in particle physics, 18:1350 (R;FR;In French)
PARTICLE INTERACTIONS
See also ELECTROPRODUCTION
PHOTON-PHOTON INTERACTIONS
Correlation between transverse momentum and multiplicity of C-jets, 18:1827 (IA;BR;In Portuguese)
Phenomenology, 18:1935 (IA;BR;In Spanish)
PARTICLE LOSSES
Orbit losses of strongly ICRF-heated ions, 18:2308 (R;SE)
PARTICLE TRACKS
Applications of discrete transformations in the problem of preliminary data processing for experiments in high energy physics, 18:1425 (R;SU;In Russian)
Track reconstruction in discrete detectors, 18:1420 (R;SU)
PARTICULATES
Combustion of dense streams of coal particles: Quarterly progress report No. 7, February 29, 1991–May 28, 1992, 18:86 (R;US)
Diagnostic behavior of the Wire Arc Plasma spray process, 18:1227 (R;US)
Mechanism of surface enrichment and adhesion of coal combustion particulates: Final report, 18:433 (R;US)
Non-intrusive measurement of particle charge: Electrostatic dry coal cleaning: Technical progress report No. 4, April 1, 1992–June 30, 1992, 18:6 (R;US)
PARTON MODEL
New information on parton distributions, 18:1954 (R;GB)
PARTONS
New information on parton distributions, 18:1954 (R;GB)
PASSIVE SOLAR HEATING SYSTEMS
Environmental and energy analysis of the plus energy house: Project using tsbi3 dynamic simulation program, 18:383 (I;DK)
PATIENTS
Statistical study on cancer patients of cancer research hospital, 18:1721 (R;KR;In Korean)
PATTERN RECOGNITION
Back propagation neural networks for facial verification, 18:2468 (R;US)
PBF REACTOR
Institute of Medicine letter report: Committee to review the Idaho National Engineering Laboratory proposal to convert its Power Burst Facility for use in boron neutron capture therapy, 18:1680 (R;US)
PEARL PULSATIONS
See PULSATIONS
PEAT
Briquetting
Experience of the peat briquette production at Haerjedalens Mineral Ab in Sveg, 18:20 (RA;FI)
Dewatering Equipment
Evaluation of the Ådewa process, 18:16 (RA;FI)
Mechanical peat dewatering in the ultrapresse unit, 18:14 (RA;FI)
Results of dewatering research in Rittenshaus and Blecher chamber filter, 18:15 (RA;FI)
Drying
Technological processes of field drying in optimum production of peat, 18:79 (R;FI)

Filtration
Some fundamental aspects of the dewatering of peat, 18:13 (RA;FI)
Gas Turbine Power Plants
New power plant connected to Adewa process, 18:19 (RA;FI)
New process alternatives for utilisation of wet peat, 18:18 (RA;FI)
Harvesting
Peat-digging all-year-round, 18:11 (RA;FI)
Pumping properties of peat slurry, 18:17 (RA;FI)
Rheological properties of wet peat, 18:70 (RA;FI)
Harvesting Equipment
Peat-digging all-year-round, 18:11 (RA;FI)
Pressing
Efficiency and environmental effects of peat dewatering by mechanical pressing, 18:12 (RA;FI)
Pumping
Pumping properties of peat slurry, 18:17 (RA;FI)
Resource Assessment
The peat resources of Iitti and their potential use, 18:75 (R;FI;In Finnish)
Rheology
Rheological properties of wet peat, 18:70 (RA;FI)
Water Removal
Artificial dewatering of peat, 18:10 (R;FI)
Efficiency and environmental effects of peat dewatering by mechanical pressing, 18:12 (RA;FI)
Evaluation of the Adewa process, 18:16 (RA;FI)
Mechanical peat dewatering in the ultrapresse unit, 18:14 (RA;FI)
Peat-digging all-year-round, 18:11 (RA;FI)
Pumping properties of peat slurry, 18:17 (RA;FI)
Results of dewatering research in Rittenshaus and Blecher chamber filter, 18:15 (RA;FI)
Some fundamental aspects of the dewatering of peat, 18:13 (RA;FI)

PELLET INJECTION
High-speed repetitive pellet injector prototype for magnetic confinement fusion devices, 18:2360 (R;US)
ORNL centrifuge pellet fueling system, 18:2359 (R;US)
Optical visualization of electric and magnetic field perturbations in tokamak discharges by hydrogen pellet injection, 18:2367 (R;FR)

PELLETS (FUEL)
See FUEL PELLETS

PELVIS
Intra-operative radiotherapy (IORT) in abdomino-pelvic malignancies, 18:1702 (IA;BR)

PENNING ION SOURCES
Cyclotron ion source with cold hollow cathode, 18:1368 (R;SU;In Russian)

PEOPLE
See HUMAN POPULATIONS

PEOPLES REPUBLIC OF CHINA
See CHINA

PEP STORAGE RINGS
Effects of parasitic beam-beam interaction during the injection process at the PEP-II B Factory, 18:1385 (R;US)

PEPPERS
Identification of irradiation of some foodstuffs using thermoluminesence procedure, 18:1719 (IA;IR;In Persian)

PEPTIDES
Instrumental and theoretical development of capillary electrophoresis and its application to biological systems, 18:1668 (R;US)

PERHYDROXYL RADICAL
See HYDROPEROXY RADICALS

PERMEABILITY COEFFICIENT (FLUID MECHANICS)
See HYDRAULIC CONDUCTIVITY

PERMUTIT (ORGANIC)
See ORGANIC ION EXCHANGERS

PERSONNEL
See also PROFESSIONAL PERSONNEL
REACTOR OPERATORS
An assessment of the potential impacts on irradiated nuclear fuel transportation operations of applying ICRP Publication 60 recommendations to transport regulations, 18:214 (R;US)
Application of RADTRAN to estimation of doses to persons in enclosed spaces, 18:1760 (R;US)
Guidelines for the medical surveillance of atomic radiation workers, 18:1746 (R;CA;In English, French)

PERSONNEL DOSIMETRY
The development of dose evaluation program for personnel radiation dosimetry, 18:1756 (R;KR;In Korean)

PERSONNEL FILM DOSIMETRY
See PERSONNEL DOSIMETRY

PERSPEX
Investigating optical properties and dosimetry of commercial plexi layers to substitue imported perspex dosimeters, 18:1411 (IA;IR;In Persian)

PERTURBATION THEORY
In what sense the canonical perturbation theory is gauge-invariant, 18:1786 (R;XA)
Variational-perturbative treatment of time dependent optical response of conjugated chains, 18:2244 (IA;BR;In Portuguese)

PEST CONTROL
Economic engineering feasibility of irradiation as a postharvest disinfestation treatment for California dried fruits and nuts, 18:1717 (RA;US)

PETROLEUM
See also PETROLEUM FRACTIONS
Comparative study of thermodynamical properties and research on miscibility between injection gases and light petroleum: Mesdar and Zarzaitine oil fields applications, 18:108 (R;FR;In French)
Draft Environmental Impact Statement on the expansion of the Strategic Petroleum Reserve, Alabama, Louisiana, Mississippi, and Texas: Volume 1, Chapters 1–5, 18:130 (R;US)
International petroleum statistics report, September 1992, 18:129 (R;US)
National Institute for Petroleum and Energy Research quarterly technical report, April 1–June 30, 1992: Volume 2, Energy production research, 18:110 (R;US)
Natural Resources Information System for the State of Oklahoma: Final report, 18:127 (R;US)
Oil containment and shipping device, 18:137 (PA;CA)
Petroleum hydrocracking face to face Molybdenum based dispersed catalyst, 18:114 (R;FR;In French)
Petroleum supply monthly, September 1992 (Contains glossary.), 18:793 (R;US)
Present status and future trend of cooperation in new energy (Canada), 18:804 (R;JP;In Japanese)
Thermal cracking of hydrocarbon mixtures at high pressure: experimental kinetic study and numerical modeling, implications for petroleum geochemistry, 18:112 (R;FR;In French)
United Kingdom's policy on energy alternatives to oil and international cooperation, 18:805 (R;JP;In Japanese)
[National Institute for Petroleum and Energy Research] quarterly technical report, April 1–June 30, 1992: Volume 1, Fuels research, 18:138 (R;US)

PETROLEUM COKE
See PETROLEUM PRODUCTS

PETROLEUM DEPOSITS
See also OIL FIELDS
US NAVAL PETROLEUM RESERVES
Characterization of oil and gas reservoir heterogeneity: Final report, 18:97 (R;US)
Characterization of oil and gas reservoir heterogeneity: Technical progress report, April 1, 1992–June 30, 1992, 18:98 (R;US)
Petroleum taxation under uncertainty - contingent claims: Analysis with an application to Norway, 18:752 (I;NO)

PETROLEUM FRACTIONS
Hydrogen interaction with catalyst support Platinum. Influence of particle size, additives and type of catalyst support, 18:113 (R;FR;In French)

PETROLEUM INDUSTRY
Guidelines on arrangement and contents of plan for development and operation of petroleum deposits, 18:122 (I;NO;In English, Norwegian)
Impact evaluation of an energy savings plan project at ARCO Petroleum Products Company, 18:894 (R;US)
Regulations concerning implementation and use of risk analyses in the petroleum activities with guidelines, 18:124 (I;NO;In English, Norwegian)
Regulations on environmental data for the petroleum activity, 18:135 (I;NO;In English, Norwegian)

PETROLEUM PRODUCTS

GASOLINE
LIQUEFIED PETROLEUM GASES
Petroleum supply monthly, September 1992 (Contains glossary.), 18:793 (R;US)
[National Institute for Petroleum and Energy Research] quarterly technical report, April 1–June 30, 1992: Volume 1, Fuels research, 18:138 (R;US)

PETROLEUM REFINERIES
Inventory of volatile organic compound emissions in Finland, 1985, 18:136 (R;FI)

PH VALUE
Changing synoptic weather patterns, rainfall regimes and acid inputs in the East Midlands, U.K., 18:1514 (RA;FI)

PHANTOMS
Construction of a phantom for evaluating performance of NMR tomographs, 18:1681 (IA;BR;In Portuguese)
Thermal neutron flux and gamma dose distribution in the phantom of head in boron neutron therapy, 18:1753 (IA;IR;In Persian)

PHARMACEUTICALS
See DRUGS

PHASE DIAGRAMS
The direct Monte Carlo method for calculating alloy phases, 18:967 (R;US)

PHASE SPACE
Phase space representations for spin 2, 18:1802 (R;SU)

PHEBUS REACTOR
Summary of the dimensioning verification studies of the Phebus-FP experiments, 18:443 (R;FR)

PHENANTHROLINES
Pulsed laser kinetic studies of liquids under high pressure: Progress report, November 25, 1991–September 18, 1992, 18:1183 (R;US)

PHENIX REACTOR
Damage of the Phenix fuel element clads. Realization and analysis of ultimate loading experiences. Validation and optimization of the RAMSESII methodology, 18:520 (R;FR;In French)

PHENOLS
Rate enhancement for catalytic upgrading coal naphthas: Quarterly project report, January–March 1992, 18:38 (R;US)

PHI4-FIELD THEORY
Character of phase transition in two- and three-dimensional scalar $g\phi^4$ theory, 18:1889 (R;SU)
Phase structure of three- and four-dimensional ϕ^4 field theory, 18:1890 (R;SU)

PHONONS
Intra and inter-sub-band transitions in quantum wires, 18:2301 (IA;BR;In Portuguese)

PHOSPHATE ROCKS
Phosphates and blackshales of the Oulab Abdoun and Timahdit basins (Morocco): Petrography, mineralogy, geochemistry and depositional environment, 18:149 (R;FR;In French)

PHOSPHOMOLYBDIC ACID
See MOLYBDOPHOSPHORIC ACID

PHOSPHONATES
The detection of organophosphonates by polymer films on a surface acoustic wave device and a micromirror fiber optic sensor, 18:950 (R;US)

PHOSPHORUS
Study of chemistry transformations of in vivo implanted coral by nuclear analysis methods, 18:1724 (R;FR;In French)

PHOSPHORUS 31 REACTIONS
Form coexistence in ^{187}Au: study of the populations of oblate and prolate systems, 18:1999 (R;FR;In French)

PHOSPHORUS IONS
Oscillator strengths for P V, S VI, Cl VII, Ar VIII and K IX, 18:2082 (R;XA)

PHOTOACOUSTIC SPECTROMETERS
Pulsed laser photoacoustic spectrometer for study of solid materials, 18:957 (R;IN)

PHOTOACOUSTIC SPECTROSCOPY
Pulsed laser photoacoustic spectrometer for study of solid materials, 18:957 (R;IN)

PHOTOCATHODES
Microchannel plate intensifier gain uniformity improvement in sealed tubes by selective scrubbing, 18:1441 (R;US)

PHOTOCHEMICAL REACTIONS
See also PHOTOSYNTHESIS
Photophysics and photoredox processes at liquid-liquid interfaces: Progress report, April 1, 1990–September 1992, 18:1185 (R;US)
Study of intermediates from transition metal excited-state electron-transfer reactions: [Annual] progress report, August 1, 1989–July 31, 1992, 18:1184 (R;US)

PHOTOCHEMISTRY
Sixteenth DOE Solar Photochemistry Research Conference: Proceedings, 18:368 (R;US)

PHOTODETECTORS
Dielectric optical waveguide sensors integrated with GaAs active devices, 18:1458 (R;US)

PHOTODIODES
Absolute spectral sensitivity of photodiode arrays in the X-ray energy range 7-20 keV, 18:1415 (R;SU;In Russian)

PHOTOELECTRIC EFFECT
Experimental measurements of total attenuation cross section and photoelectric cross section for Fe, Cu, Sn, Y, SiH_4 and Si in the X-ray energy range of 1,4 KeV - 29 KeV: Final report for the period 15 December 1988 - 14 May 1992, 18:2058 (R;XA)

PHOTOLUMINESCENCE
GaAs-(Ga,Al)As quantum wires: a study on photoluminescence spectrum related to plain receiver impurities, 18:2250 (IA;BR;In Portuguese)
Photoluminescence of the $Ga_{1-x}Al_xAs$:si confining layer of doped asymmetrically quantum wells (SAQW) growth by MBE, 18:2276 (IA;BR;In Portuguese)

PHOTOMAGNETIC EFFECT

Chemical Processing Department monthly report, June 1959, 18:208 (R;US)
Chemical Processing Department monthly report, March 1959, 18:205 (R;US)
Chemical Processing Department monthly report, May 1959, 18:207 (R;US)
Chemical Processing Department monthly report, October 1957, 18:204 (R;US)

Purification
Studies on resin degradation products encountered during purification of plutonium by anion exchange, 18:185 (R;IN)

Radiation Heating
Study of plutonium volatility under microwave melting conditions used for glass encapsulation of plutonium sludge wastes: An interim report, 18:272 (R;US)

Solubility
Near-field solubility studies, 18:248 (R;GB)

Solvent Extraction
Extraction of actinides from chloride medium using pentaalkylpropanediamides, 18:1189 (R;FR)
New organic chelating agents for complexation of cations. Application to nuclear waste treatment, 18:222 (R;FR)

Volatility
Study of plutonium volatility under microwave melting conditions used for glass encapsulation of plutonium sludge wastes: An interim report, 18:272 (R;US)

PLUTONIUM 238
River versus atmospheric inputs to the Western Mediterranean: Annex 3, 18:1639 (RA;XU)
US Department of Energy Nevada Field Office annual site environmental report, 1991: Volume 2, Appendices, 18:1490 (R;US)

PLUTONIUM 239
Dependence of electronuclear characteristics on ^{239}Pu and ^{235}U concentration, 18:588 (R;SU;In Russian)
River versus atmospheric inputs to the Western Mediterranean: Annex 3, 18:1639 (RA;XU)
The Cambric migration experiment: A summary report, 18:1573 (R;US)
US Department of Energy Nevada Field Office annual site environmental report, 1991: Volume 2, Appendices, 18:1490 (R;US)

PLUTONIUM 240
River versus atmospheric inputs to the Western Mediterranean: Annex 3, 18:1639 (RA;XU)
US Department of Energy Nevada Field Office annual site environmental report, 1991: Volume 2, Appendices, 18:1490 (R;US)

PLUTONIUM DIOXIDE
Study by X-ray diffraction of structure modifications induced by pressure in different actinide compounds: AnO_2 dioxides (An=Th, Pu, Am), $AnCl_4$ tetrachlorides (An=Th, U), UB_x borides (x=2,4,12) and the carbide UC_2, 18:1043 (R;FR;In French)

PNA

ROBOTS
The development of robot application technology in nuclear facilities, 18:442 (R;KR;In Korean)
ROCK MECHANICS
Assessment of computer programs for coupled fluid flow-thermal-mechanical processes in the assessment of deep disposal of radioactive waste, 18:243 (R;CA)
ROCK-FLUID INTERACTIONS
Brief guide to the MINC-method for modeling flow and transport in fractured media, 18:1778 (R;US)
Geochemical modelling of grout-groundwater-rock interactions at the seal-rock interface, 18:1619 (R;SE)
Redox capacity of crystalline rocks. Laboratory studies under 100 bar oxygen gas pressure, 18:1176 (R;SE)
ROCKET REACTOR EXPERIMENT ROVER
See ROVER REACTORS
ROCKS
Microbes in crystalline bedrock. Assimilation of CO_2 and introduced organic compounds by bacterial populations in groundwater from deep crystalline bedrock at Laxemar and Stripa, 18:1594 (R;SE)
Reactive fluid flow models and applications to diagenesis, mineral deposits and crustal rocks: Progress report, 18:1777 (R;US)
Study on radioactivation analysis, 18:1571 (R;KR)
ROD DROP ACCIDENTS
Accidental dropping of control rods: Minutes of meeting, 18:707 (R;US)
RODS (CONTROL)
See CONTROL ELEMENTS
RODS (FUEL)
See FUEL RODS
ROOFS
System effects on the thermal aging of experimental polyisocyanurate roof insulation foamed with an alternative blowing agent, 18:835 (R;US)
ROOM AND PILLAR MINING
A waterjet mining machine for use in room and pillar mining operations: [Final report], 18:76 (R;US)
ROPER RESONANCE
See N-1440 BARYONS
ROTARY DRILLS
Sealing system for a sealed bearing assembly used in earth drilling, 18:1267 (PA;CA)
ROVER REACTORS
Handling effluent from nuclear thermal propulsion system ground tests, 18:539 (R;US)
RUBIDIUM SULFATES
Phase transformations in lithium and rubidium sulfate, 18:1099 (IA;BR;In Portuguese)
RUNOFF
Active layer hydrology for Imnavait Creek, Toolik, Alaska: Annual progress report, July 1984–January 1986, 18:1557 (R;US)
Anthropogenic changes or climate, water resources and water management problems, 18:1530 (RA;FI)
Impact of greenhouse effect on sewerage systems, 18:1657 (RA;FI)
RUPTURES
Damage of the Phenix fuel element clads. Realization and analysis of ultimate loading experiences. Validation and optimization of the RAMSESII methodology, 18:520 (R;FR;In French)
RUTHENIUM
First-principles studies of phase stability and the structural and dynamical properties of metal hydrides: Progress report, September 15, 1991–September 14, 1992, 18:2090 (R;US)
RUTHENIUM 106
The Cambric migration experiment: A summary report, 18:1573 (R;US)
RUTHENIUM COMPLEXES
Study of intermediates from transition metal excited-state electron-transfer reactions: [Annual] progress report, August 1, 1989–July 31, 1992, 18:1184 (R;US)
RUTHERFORD SCATTERING
Investigation of silicon dioxide buried layers by ion Rutherford backscattering, 18:2191 (R;SU;In Russian)
RWE-BAYERNWERK REACTOR
Pilot dismantling of the KRB A BWR at Gundremmingen. Phase 1 - Dismantling of contaminated and activated components, 18:459 (RA;FR)

S

S CODES
Program SITHA. New version of the multigroup system of the neutron cross section GR175-V1, 18:2062 (R;SU;In Russian)
SCAP: Point kernel single or albedo scatter, 18:2446 (CM;US)
SXLSQA: For the interpretation of solvent extraction data, 18:2426 (CM;US)

SUPERCONDUCTING COILS
Conceptual design of the CMS 4 Tesla solenoid, 18:2199 (R;FR)
Fabrication and properties of high-T_c tapes and coils made from silver-clad Bi-2223 superconductors, 18:2195 (R;US)
Stress relaxation in SSC 50mm dipole coils, 18:1358 (R;US)
Theoretical methods for creep and stress relaxation studies of SSC coil, 18:1359 (R;US)

SUPERCONDUCTING COMPOSITES
Conductance in high T_c compounds, 18:2263 (IA;BR;In Portuguese)
Study on formation kinetic of isostructural Bi-Sr-Co-O compounds to Bi-Sr-Ca-Cu-O high T_c superconductors, 18:2214 (IA;BR;In Portuguese)

SUPERCONDUCTING CYCLOTRONS
Magnetic study of extraction elements of compact cyclotron beam with AGOR superconducting coils, 18:1363 (R;FR;In French)
Neutron multiplicity distributions for 30 MeVu ^{14}N reactions with the indicated targets: Progress in research, April 1, 1991–March 31, 1992, 18:1985 (R;US)

SUPERCONDUCTING DEVICES
See also SUPERCONDUCTING CAVITY RESONATORS
SUPERCONDUCTING MAGNETS
Design and modeling of superconducting RFQ structures, 18:1285 (R;US)
Potential impact of superconductivity on power quality enhancement, 18:728 (R;US)

SUPERCONDUCTING FILMS
Fabrication and properties of high-$T_c$tapes and coils made from silver-clad Bi-2223 superconductors, 18:2195 (R;US)
Large magnetic field induced fluctuation effect in superconducting $Bi_2Sr_2Ca_2Cu_3O_{10}$ tape, 18:1035 (R;US)
Local critical current measurements on $(Bi,Pb)_2Sr_2Ca_2Cu_3O_x$ tape with an electromagnetic probe, 18:1029 (R;US)
Measurement of magnetic field penetration depth in niobium polycrystalline films by polarized neutron reflection method, 18:2222 (R;SU)
Measurements of AC electric resistivity in $Y_1Ba_2Cu_3O_{7-x}$ thick films, 18:2215 (IA;BR;In Portuguese)

SUPERCONDUCTING JUNCTIONS
Effect of air-tightness in superconducting junctions, 18:2216 (IA;BR;In Portuguese)

SUPERCONDUCTING MAGNETIC ENERGY STORAGE
Design aspects of mid-size SMES using high temperature superconductors, 18:736 (R;US)

SUPERCONDUCTING MAGNETS
Application of superconductivity for large equipments in physics, 18:2198 (R;FR;In French)
Cold mass mechanical design, quench and mechanical test results for full length 50 mm aperture SSC model dipoles built at BNL, 18:1390 (R;US)
Correcting field harmonics after design in superconducting magnets, 18:1307 (R;US)
Cryotribology: Development of cryotribological theories and application to cryogenic devices: Interim report, June 15, 1985–August 31, 1992, 18:2202 (R;US)
DCA211 failure analysis report, 18:1388 (R;US)
Mathematical models of hysteresis: Progress report, January 1992–December 1992, 18:2203 (R;US)
New devices for the magnetic center location of quadrupole magnets, 18:2200 (R;FR)
Prototype of superconducting magnet for magnetohydrodynamic energy generator, 18:2204 (IA;BR;In Portuguese)
Recent status of superconductors for accelerator magnets, 18:1346 (R;US)
SSC 50 mm collider dipole cryostat single tube support post conceptual design and analysis, 18:1357 (R;US)

SUPERCONDUCTING SUPER COLLIDER
Cold mass mechanical design, quench and mechanical test results for full length 50 mm aperture SSC model dipoles built at BNL, 18:1390 (R;US)
DCA211 failure analysis report, 18:1388 (R;US)
Effect of transients on the beam in the Superconducting Supercollider Coupled-Cavity Linac, 18:1323 (R;US)
End design of the SSC 58 mm High Gradient Quadrupole, 18:1383 (R;US)
FAD: A full-acceptance detector for physics at the SSC, 18:1440 (R;US)
Fully pipelined and programmable Level 1 trigger: Revision A, 18:1387 (R;US)
Kinematic analysis of Six Strut Support System for super collider components, 18:1301 (R;US)
Response to concerns of the EM review committee, 18:1398 (R;US)

SUPERCONDUCTING WIRES
A study on the development of high-Tc superconducting wire, 18:2226 (R;KR;In Korean)
Hysteretic losses in NbTi superconducting wires, 18:2267 (IA;BR;In Portuguese)
Progress toward application of bulk high-T_c superconductors, 18:1028 (R;US)

SUPERCONDUCTIVITY
Effects of aging and granulometry on oxygen content and on superconducting transition of $YBa_2Cu_3O\text{-}7_{-\delta}$, 18:2210 (IA;BR;In Portuguese)
Multivortex states in large pinnig centers, 18:2220 (IA;IL)
Superconductivity in two-band systems: application to transition metals and high-T_c materials, 18:2212 (IA;BR)
The superconductivity research in Brazil, 18:2209 (IA;BR;In Portuguese)

SUPERCONDUCTORS
See also HIGH-TC SUPERCONDUCTORS
TYPE-II SUPERCONDUCTORS
^{57}ion implantation in superconducting materials, 18:2140 (IA;BR;In Portuguese)
A possibility to investigate the superconducting gap with the help of neutrons, 18:2224 (R;SU;In Russian)
Concerning factors which determine whether flux-lattice shear or pin breaking limits the critical current density of superconductors, 18:2197 (R;US)
Effect of CuO substitution by NiS on $YBa_2Cu_3O_{7-\delta}$ superconductivity, 18:2205 (IA;BR;In Portuguese)
Effects of uniaxial symmetry in the supercurrent distribution surrounding the vortex in the London approximation, 18:2206 (IA;BR)
Elastic properties of vortice lattices in layer structure superconductors, 18:2259 (IA;BR;In Portuguese)
Electronic structure and optical spectra of $YBa_2Cu_{3-x}M_xO_{7-\delta}$ superconductor, 18:2265 (IA;BR;In Portuguese)
Fast convergent free energy expansion for uniaxial superconductors in the London approximation, 18:2207 (IA;BR)
Influence of microstructure on irreversibility curve of $YBa_2Cu_3O_{7-\delta}$, 18:2262 (IA;BR;In Portuguese)
Irradiation of $TlBa_2CaCu_2O_x$ monocrystals by heavy ions, 18:2176 (IA;BR;In Portuguese)
Kinetic study on oxygen desorption in Fe: $YBa_2Cu_3O_{7-d}$ superconducting oxides, 18:2141 (IA;BR;In Portuguese)
MBE of high T_c superconducting oxides: a personnel point of view, 18:2213 (IA;BR;In Portuguese)
Magnetic ordering in Fe: $YBa_2Cu_3O_7$ superconducting oxides, 18:2142 (IA;BR;In Portuguese)
Study on electronic structure of superconductors at high temperature by x-ray absorption spectroscopy (XAS), 18:2143 (IA;BR;In Portuguese)

SUPERCRITICAL FLOW
See TURBULENT FLOW

SUPERGRAVITY
Parity-violating anomaly in three-dimensional supergravity, 18:1868 (IA;BR)

SUPERLATTICES
Conduction sub-bands of PbTe-$Pb_{1-x}Sn_xTe$ superlattice under magnetic field parallel to interfaces, 18:2297 (IA;BR;In Portuguese)
Electronic states in Ge/Si superlattices studied by electroreflectance, 18:2248 (IA;BR;In Portuguese)
Electronic states in quantum wells with periodically structured interfaces, 18:2092 (R;XA)
Electronic structure of $(GaP)_n(InP)_n$ and $(GaAs)_n(InAs)_n$ superlattices with ≤ 7, 18:2289 (IA;BR)
Light propagation in quasi-periodic superlattices, 18:2294 (IA;BR;In Portuguese)
Photoluminescence in asymmetrically doped quantum wells, 18:2298 (IA;BR;In Portuguese)
Results of photomodulated spectroscopy in superlattices and quantum wells of $In_xGa_{1-x}As/GaAs$, 18:2256 (IA;BR;In Portuguese)

Superlattices submitted to electric and magnetic fields, 18:2291 (IA;BR;In Portuguese)

SUPEROXIDE DISMUTASE
Biomonitoring of uranium and heavy metal pollution, 18:1764 (R;KR;In Korean)

SUPERSYMMETRIC PARTICLES
See SPARTICLES

SUPERSYMMETRY
Higgs bosons beyond Minimal Standard Model, 18:1961 (RA;FR;In French)
Reexamining the fermion mass relations in the supersymmetric SU(4)xO(4) GUT model, 18:1922 (R;GB)
Superfield actions for N=4 WZNW-Liouville systems, 18:1887 (R;SU)
Supersymmetric theories and finiteness, 18:1907 (IA;BR)
Supersymmetry and new analytical (exact) solutions of Schroedinger equation, 18:1874 (IA;BR;In Portuguese)
Symmetry of wavefunctions in quantum algebras and supersymmetry, 18:1842 (R;US)

SUPERTANKERS

TIME PROJECTION CHAMBERS
Behavior of TPC's in a high particle flux environment, 18:1343 (R;US)
TIN
Experimental measurements of total attenuation cross section and photoelectric cross section for Fe, Cu, Sn, Y, SiH_4 and Si in the X-ray energy range of 1,4 KeV - 29 KeV: Final report for the period 15 December 1988 - 14 May 1992, 18:2058 (R;XA)
Near-field solubility studies, 18:248 (R;GB)
TIN ALLOYS
Orientational phase transitions in alloys, 18:955 (R;US)
The effect of low Au concentrations on the properties of eutectic Sn/Pb, 18:1015 (R;US)
TIN COMPOUNDS
Density of states and Moessbauer hyperfine interactions of Sn compounds, 18:2134 (IA;BR;In Portuguese)
TIRES
Surface-modification technology for scrap tire reuse: A technical brief, 18:881 (R;US)
TITANATES
See also PZT
Desulfurization of hot fuel gas produced from high-chlorine Illinois coals: Technical report, March 1, 1992–May 31, 1992, 18:49 (R;US)
TITANIUM
Improvement in the synthesis of Ni/Ti neutron mirrors, 18:1026 (R;US)
Study on the causes of failures in the Titanium tubes of condensers of nuclear power plant, 18:1008 (R;KR;In Korean)
TITANIUM ALLOYS
Deformation twinning in ordered alloys transformation induced ductility in intermetallics: Final report, 18:976 (R;US)
First-principles approach to alloy phase stability, 18:1027 (R;US)
TITANIUM BORIDES
Ceramics models in the MESA codes, 18:1069 (R;US)
TITANIUM OXIDES
Catalytic fabric filtration for simultaneous NO_x and particulate control: Quarterly technical progress report, April 1–June 30, 1992, 18:431 (R;US)
Energetics, bonding mechanism and electronic structure of metal/ceramic interfaces: Annual progress report, April 1, 1992–March 31, 1993, 18:1038 (R;US)
TOKAMAK DEVICES
See also ALCATOR DEVICE
DOUBLET-3 DEVICE
ITER TOKAMAK
JET TOKAMAK
TFTR TOKAMAK
TORE SUPRA TOKAMAK
Alfven Waves
Multiple-gap theory of toroidal Alfven waves with kinetic effects, 18:2326 (R;US)
Banana Regime
A self-consistent turbulence generated scenario for L-H transition, 18:2327 (R;US)
Beam Injection Heating
Calculation of neutral beam deposition accounting for excited states, 18:2393 (R;US)
Drift Instability
Toroidal effects on drift wave turbulence, 18:2320 (R;US)
Magnetic Fields
Nonlinear mechanism for the suppression of error field magnetic islands by plasma flow, 18:2343 (RA;CH)
Magnetic Islands
Nonlinear mechanism for the suppression of error field magnetic islands by plasma flow, 18:2343 (RA;CH)
Plasma Confinement
Plasma physics research in the MST toroidal confinement device: Progress report, November 1, 1991–June 15, 1992, 18:2312 (R;US)
[Magnetic fusion theory and experimental research and development]: Progress report, November 1, 1991–October 30, 1992, 18:2315 (R;US)
Plasma Diagnostics
Plasma physics research in the MST toroidal confinement device: Progress report, November 1, 1991–June 15, 1992, 18:2312 (R;US)
Plasma Scrape-Off Layer
Electron-temperature-gradient-induced instability in tokamak scrape-off layers, 18:2324 (R;US)
Plasma Simulation
Particle simulations in toroidal geometry, 18:2323 (R;US)
Research Programs
The ARIES-I tokamak reactor study: Volume 2, final report, 18:2391 (R;US)
Sawtooth Oscillations
Effect of sawteeth on alpha power deposition and ignition in Tokamaks, 18:2310 (R;SE)
Systems Analysis
A systems analysis of the ARIES tokamak reactors, 18:2385 (R;US)
Transport Theory
Applications of computer modeling to fusion research: Progress report, 1988–1989, 18:2316 (R;US)
Turbulent Flow
Correlation theory of a two-dimensional plasma turbulence with shear flow, 18:2325 (R;US)
Tokamak turbulence in self-regulated differentially rotating flow and L-H transition dynamics, 18:2305 (R;US)
Wall Effects
Particle flux across a stochastic magnetic layer, 18:2369 (R;FR)
Plasma surface interactions in controlled fusion devices, 18:2370 (R;FR)
Radiation control and study of a Tokamak plasma. Use of an ergodic divertor, 18:2379 (R;FR;In French)
TOKAMAK FUSION TEST REACTOR
See TFTR TOKAMAK
TOLUENE
Incineration of toluene and chlorobenzene in a laboratory incinerator, 18:1199 (R;US)
Sorption and chemical transformation of PAHs on coal fly ash: Technical progress report No. 3, May 1–July 31, 1992, 18:435 (R;US)
TONGUE
Glottic cancer and fraction size, 18:1703 (IA;BR)
TOPOLOGY
Topology and statistics in zero dimensions, 18:1784 (R;IL)
TORE SUPRA
See TORE SUPRA TOKAMAK
TORE SUPRA TOKAMAK
Effects of ionizing scrape-off layers on local recycling in Tore Supra pump limiter experiments, 18:2378 (RA;FR)
Impurity screening in Tore Supra, 18:2376 (RA;FR)
Localised measurements of turbulence in the Tore Supra tokamak, 18:2328 (R;FR)
ORNL centrifuge pellet fueling system, 18:2359 (R;US)
Plasma wall particle balance in Tore Supra, 18:2373 (RA;FR)
Transport in the plasma edge specific connection to the wall in the Tore Supra ergodic divertor experiments, 18:2371 (RA;FR)
TOTAL-ABSORPTION SPECTROMETERS
See SHOWER COUNTERS
TOXIC MATERIALS
Atmospheric transport analysis used in hazard screening methodology, 18:1537 (R;US)
Reductive mobilization of oxide-bound metals: Progress report, September 15, 1991–September 15, 1992, 18:1631 (R;US)
TPC
See TIME PROJECTION CHAMBERS
TRACER TECHNIQUES
Site characterization and validation - tracer migration experiment in the validation drift, report 1: Instrumentation site preparation and tracers, 18:1606 (R;SE)
TRACK DETECTORS (DIELECTRIC)
See DIELECTRIC TRACK DETECTORS
TRACKS
See PARTICLE TRACKS

TRAJECTORIES
Quadrupole error effects in the Arcs, 18:1310 (R;FR)
TRANSCRIPTION FACTORS
Neutron scatter studies of chromatin structures related to functions: Technical progress report, November 1, 1991–May 15, 1992, 18:1665 (R;US)
TRANSFER (HEAT)
See HEAT TRANSFER
TRANSFER (IN ENVIRONMENT)
See RADIONUCLIDE MIGRATION
TRANSFER (MASS)

TRANSPORT (RADIATION)
See RADIATION TRANSPORT
TRANSPORTATION SECTOR
A review of selected energy-related data sets, 18:786 (R;US)
How can the environmental load of the transport sector be influenced? (Transport management), 18:876 (IA;DK;In Danish)
Trends in transportation energy use, 1970–1988: An international perspective, 18:871 (R;US)
TRANSPORTATION SYSTEMS
Public transport and the economy, 18:872 (IA;DK;In Swedish)
Quality of life, environment and transport (Denmark), 18:1772 (IA;DK;In Danish)
Strasbourg's transport policy (Transport management), 18:1771 (IA;DK;In Danish)
Study on the clean energy network sytem for the global environment, 18:781 (R;JP;In Japanese)
Transport model for the metropolitan region and development trends in transport (Transport management), 18:875 (IA;DK;In Danish)
Urban environment and transport must always go hand-in-hand (Transport management), 18:874 (IA;DK;In Danish)
Why is it that people do not choose public transport? (Transport management), 18:873 (IA;DK;In Norwegian)
TRANSPOSONS
Advanced sequenching technology: Second year progress report, 18:1666 (R;US)
Genomic variation in maize: Progress report, 1990, 18:318 (R;US)
TRANSURANIUM WASTES
See ALPHA-BEARING WASTES
TRAPS
Revised nomenclature for defects at or near the Si/SiO_2 interface, 18:1280 (R;US)
TREES
See also POPLARS
WILLOWS
Global climate change: Some implications, opportunities, and challenges for US forestry, 18:1551 (R;US)
TRIGA-2-SEOUL REACTOR
TRIGA mark-II,III reactor safety re-evaluation, 18:716 (R;KR;In Korean)
TRIGA-3-SEOUL REACTOR
TRIGA mark-II,III reactor safety re-evaluation, 18:716 (R;KR;In Korean)
TRIGGER CIRCUITS
Fully pipelined and programmable Level 1 trigger: Revision A, 18:1387 (R;US)
TRIPLET PARTICLES
See QUARKS
TRITIATED COMPOUNDS
See TRITIUM COMPOUNDS
TRITIUM
A study on the separation characteristics of tritiated water vapor adsorption-II, 18:1170 (R;KR;In Korean)
A survey of methods for the determination of tritium, 18:198 (R;US)
Construction of the wave function of tritium/helium-3 using a method based on the extraction of leading singularities, 18:2006 (R;SU)
Effects of microdistribution of tritium on dose calculations, 18:1749 (R;CA)
Field sampling and analysis plan for the remedial investigation of Waste Area Grouping 2 at Oak Ridge National Laboratory, Oak Ridge, Tennessee: Environmental Restoration Program, 18:225 (R;US)
Further adaptation of the European ceramic-B.I.T. blanket conceptual design to updated Demo specifications, 18:2352 (R;FR)
Toxicity and dosimetry of tritium: A review, 18:1743 (R;CA;In English, French)
US Department of Energy Nevada Field Office annual site environmental report, 1991: Volume 2, Appendices, 18:1490 (R;US)
UTIAS tritium exposure facility for fusion materials studies, 18:2354 (R;CA)
TRITIUM COMPOUNDS
High emissivity TiC coatings for a first wall: Presented at the Second International Symposium on Fusion Nuclear Technology, June 2-7, 1991, Karlsruhe, Germany, 18:2362 (R;NL)
TROPOSPHERE
Tropospheric sampling with aircraft, 18:1474 (R;US)
TROUT
Supplementation in the Columbia Basin, Part 1: Rasp summary report series, background, description, performance measures, uncertainty, and theory, 18:1628 (R;US)
TRU WASTES
See ALPHA-BEARING WASTES
TRUCKS
Technical documentation for the 1990 Nationwide Truck Activity and Commodity Survey Public Use File, 18:878 (R;US)
TRX-1
See REVERSE-FIELD PINCH
TUBES
See also PRESSURE TUBES
Improvements of the tubes ut inspection using a rotating probe and data processing, 18:1262 (R;FR)
New fuel element development: Trip report, ALCOA, New Kensington, May 5, 6, 1952, 18:585 (R;US)

Study on the causes of failures in the Titanium tubes of condensers of nuclear power plant, 18:1008 (R;KR;In Korean)

TUMORS
See NEOPLASMS

TUNDRA
Impact of a repository on permafrost development during glaciation advance, 18:1592 (R;SE)
Research on the seasonal snow of the Arctic Slope: Annual progress report, July 15, 1984–January 15, 1986, 18:1556 (R;US)

TUNGSTEN
Damage produced by swift heavy ions in monocrystalline tungsten, 18:2189 (R;SU;In Russian)
Investigation of tungsten and lead structural materials activation by 1.0-1.1 GeV protons, 18:1005 (R;SU)
Modeling of the vacuum plasma spray process, 18:1020 (R;US)

TUNGSTEN CARBIDES
Sintering of tungsten carbide using iron as binders, 18:1045 (IA;BR;In Portuguese)

TUNNEL EFFECT
Tunneling between two-dimensional systems, 18:2303 (IA;BR;In Portuguese)

TUNNELS
Underground Research Laboratory room 209 instrument array. Vol. 1,2: Measured response to excavation, 18:217 (R;CA)

TURBULENCE
Selection of an anemometer for the measurement of wind turbulence, 18:417 (R;NL)

TURBULENT FLOW
Correlation theory of a two-dimensional plasma turbulence with shear flow, 18:2325 (R;US)
Numerical simulation of stratified flows with different k-ϵ turbulence models, 18:1257 (I;NO)

TVO-1 REACTOR
Analysis of failure and maintenance experiences of motor operated valves in a Finnish nuclear power plant, 18:462 (R;FI)

TVO-2 REACTOR
Analysis of failure and maintenance experiences of motor operated valves in a Finnish nuclear power plant, 18:462 (R;FI)

TWO-NUCLEON TRANSFER REACTIONS
Analyzing power of the $^{34}S(p, t)^{32}S$ reaction at 30 and 40 MeV, 18:2026 (RA;PL)

TWO-PHASE FLOW
A computational model for coal transport and combustion: Quarterly technical progress report, June 1, 1992–August 31, 1992, 18:1239 (R;US)
Development of an electrical impedance computed tomographic two-phase flows analyzer: Progress report for the period 1 October 1990–31 May 1992, 18:1235 (R;US)
Fuel channel refilling: Data analysis, 18:512 (R;CA)
Interfacial area and interfacial transfer in two-phase flow systems: Annual technical progress report, 1991–1992, 18:1236 (R;US)
Present state-of-the-art of two-phase flow model calculations, 18:81 (R;US)
Transient simulation of 2-3D stratified and intermittent two-phase flows, 18:1256 (I;NO)

TYPE-II SUPERCONDUCTORS
Preparation of high temperature superconductor ceramics using cuban reactives. Optimization of the synthesis method, 18:1036 (I;CU;In Spanish)

TYPE-III SUPERCONDUCTORS
See TYPE-II SUPERCONDUCTORS

U

U CENTERS
The finite U Hubbard model by Kadanoff-Baym method, 18:2230 (IA;BR;In Portuguese)

U CODES
UCBNE10.4: radionuclide migration porous media, 18:2443 (CM;US)
UCBNE25: radionuclide migration geologic media, 18:2442 (CM;US)

UBIQUINONE
Analysis of thermally-stable electron transport factors from the hyperthermophilic archaebacterium Pyrodictium brockii: Progress report, 18:328 (R;US)

ULCC
See TANKER SHIPS

ULTRASONIC TESTING
Improvement of ultrasonic examination using the Spartacus system, 18:1261 (R;FR)
Improvements of the tubes ut inspection using a rotating probe and data processing, 18:1262 (R;FR)
Simulations of ultrasonic examination using focused beams properties, 18:1260 (R;FR)
Ultrasonic testing X gammagraphy, 18:1263 (I;BR;In Portuguese)

UNCERTAINTY
See DATA COVARIANCES

UNDERGROUND
Factors affecting transport of bacterial cells in porous media: Technical progress report, 18:1561 (R;US)
Physiological and phylogenetic study of microbes from geochemically and hydrogeologically diverse subsurface environments: Interim technical report, November 1, 1991–September 30, 1992, 18:1562 (R;US)

UNDERGROUND DISPOSAL
Heat propagation from a radioactive waste repository. SKB 91 reference canister, 18:1596 (R;SE)
Survey of in situ testing at underground laboratories with application to geologic disposal of spent fuel waste in crystalline rock, 18:289 (R;SE)
Survey on CO_2 disposal method using salt groundwater, 18:889 (R;JP;In Japanese)
The corrosion kinetics of borosilicate glasses for radioactive waste disposal, 18:244 (IA;CH)

UNDERGROUND EXPLOSIONS
Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1, 18:1464 (R;US)
Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 2, 18:1465 (R;US)

UNDULATORS
See WIGGLER MAGNETS

UNGLAZED SOLAR COLLECTORS
Iso solar thermal standards studies to improve technical and scientific information for the finalization of performance test procedures, 18:385 (R;FR)

UNIPOLAR TRANSISTORS
See FIELD EFFECT TRANSISTORS

UNITED KINGDOM
Pilot tests on radioactive waste disposal in underground facilities, 18:234 (R;FR)
United Kingdom's policy on energy alternatives to oil and international cooperation, 18:805 (R;JP;In Japanese)

UNITED STATES OF AMERICA
See USA

UNIVERSE
Choice and meaning in the quantum universe, 18:1832 (R;US)
Measuring q_0 using supernovae at $z \approx 0.3$, 18:1834 (R;US)

UNIVERSITY OF TEHERAN RESEARCH REACTOR
See UTRR REACTOR

URANINITES
An evaluation of the dissolution process of natural uranium ore as an analogue of nuclear fuel, 18:155 (R;CA)

URANIUM
Adsorption
Studies of the effects of organic materials on the sorption of uranium(IV) and thorium(IV) on London clay and Caithness flagstones, 18:249 (R;GB)
Biological Effects
Biomonitoring of uranium and heavy metal pollution, 18:1764 (R;KR;In Korean)
Canning
Trip report, Hanford, May 19–22, 1952: [Irrodiction results; uranium canning], 18:627 (R;US)

Corrosion
Trip report: Argonne National Laboratory, June 25, 1952, 18:170 (R;US)
Diffusion
Analysis of diffusive mass transport in a cracked buffer, 18:1544 (R;CA)
Dissolution
Physical characteristics and solubility of long-lived airborne particulates in uranium producing and manufacturing facilities: A report upon completion of the extension to Phase I of the study, 18:1742 (R;CA)
Fluorescence Spectroscopy
Laser based analytical spectroscopy of uranium, 18:1128 (R;IN)
Fuel Reprocessing Plants
Analytical techniques for in-line/on-line monitoring of uranium and plutonium in process solutions : a brief literature survey, 18:184 (R;IN)
Heat Treatments
Uranium experimental program heat treatment, 18:166 (R;US)
Materials Recovery
U-237 in recovered uranium, 18:194 (R;US)
Microorganisms
Microbial treatment of aqueous wastes, 18:246 (R;KR;In Korean)
Natural Occurrence
Aqueous uranium concentrations in the natural environment, 18:1568 (R;CA)
On-Line Measurement Systems
Analytical techniques for in-line/on-line monitoring of uranium and plutonium in process solutions : a brief literature survey, 18:184 (R;IN)
Quantitative Chemical Analysis
Laser based analytical spectroscopy of uranium, 18:1128 (R;IN)
Radioecological Concentration
Colonie Interim Storage Site annual environmental report for calendar year 1991, Colonie, New York: Formerly Utilized Sites Remedial Action Program (FUSRAP), 18:297 (R;US)
Solvent Extraction
Extraction of actinides from high level waste streams of Purex process using mixtures of CMPO and TBP in dodecane, 18:187 (R;IN)
Stockpiles
[Letter to Curtis A. Nelson detailing uranium requirements for R and D], 18:165 (R;US)
Uptake
Microbial treatment of aqueous wastes, 18:246 (R;KR;In Korean)
Voltametry
Coulometric determination of uranium using platinum and mercury electrodes, 18:1144 (R;DZ;In French)
X-Ray Spectroscopy
The X-ray spectra of Ta and U following the collisions with energetic ions, 18:2078 (RA;PL)

URANIUM 235
Dependence of electronuclear characteristics on ^{239}Pu and ^{235}U concentration, 18:588 (R;SU;In Russian)

URANIUM 235 TARGET
Obtention of thin depositions by the vacuum evaporation technique, 18:1190 (I;CU;In Spanish)

URANIUM 238
Physical characteristics and solubility of long-lived airborne particulates in uranium producing and manufacturing facilities: A report upon completion of Phase I of the study, 18:1741 (R;CA)
Radiological survey results at 13 Cliff Street, Beverly, Massachusetts (VB015), 18:1576 (R;US)
Radiological survey results at 14 Cliff Street, Beverly, Massachusetts (VB011), 18:1578 (R;US)
Radiological survey results at 2 Porter Street, Beverly, Massachusetts (VB005), 18:1577 (R;US)
Radiological survey results at 20 Cliff Street, Beverly, Massachusetts (VB013), 18:1580 (R;US)
Radiological survey results at 8 Cliff Street, Beverly, Massachusetts (VB009), 18:1581 (R;US)

URANIUM 238 TARGET
Obtention of thin depositions by the vacuum evaporation technique, 18:1190 (I;CU;In Spanish)

URANIUM ALLOYS
See also URANIUM BASE ALLOYS
Diffusion studies of uranium-aluminum materials: Mark VI-J fuel elements, 18:618 (R;US)

URANIUM BASE ALLOYS
Corrosion testing program at Argonne National Laboratory, 18:625 (R;US)
New fuel element development report of meeting, June 16, 1952, 18:169 (R;US)
New fuel element development, alloy development: Trip report, BMI, June 19, 1952, 18:168 (R;US)
Trip report: Argonne National Laboratory, April 10, 1952, 18:978 (R;US)

URANIUM BORIDES
Study by X-ray diffraction of structure modifications induced by pressure in different actinide compounds: AnO_2 dioxides (An=Th, Pu, Am), $AnCl_4$ tetrachlorides (An=Th, U), UB_x borides (x=2,4,12) and the carbide UC_2, 18:1043 (R;FR;In French)

URANIUM CARBIDES
Study by X-ray diffraction of structure modifications induced by pressure in different actinide compounds: AnO_2 dioxides (An=Th, Pu, Am), $AnCl_4$ tetrachlorides (An=Th, U), UB_x borides (x=2,4,12) and the carbide UC_2, 18:1043 (R;FR;In French)

URANIUM CHLORIDES
Study by X-ray diffraction of structure modifications induced by pressure in different actinide compounds: AnO_2 dioxides (An=Th, Pu, Am), $AnCl_4$ tetrachlorides (An=Th, U), UB_x borides (x=2,4,12) and the carbide UC_2, 18:1043 (R;FR;In French)

URANIUM COMPLEXES
Synthesis and reactivity of triscyclopentadienyl uranium (III) and (IV) complexes, 18:1191 (R;FR;In French)

URANIUM DIOXIDE
An electrochemistry-based model for the dissolution of UO_2, 18:1024 (R;SE)
Fission-product releases from UO_2 in air and inert conditions at 1700-2350 K: Analysis of the MCE-1 experiment, 18:158 (R;CA)
High density UO_2 powder preparation for HWR fuel, 18:174 (R;KR;In Korean)
The cathodic reduction of dioxygen on uranium oxide in dilute alkaline aqueous solution, 18:1146 (R;CA)

URANIUM IONS
A study on ion separation through liquid membrane, 18:1196 (R;KR;In Korean)

URANIUM NITRATES
Role of ion transfer membrane in the production of uranous nitrate, 18:186 (R;IN)

URANIUM ORES
Potential health hazard of nuclear fuel waste and uranium ore, 18:1726 (R;CA)

URANIUM OXIDES
See also URANIUM DIOXIDE
Slow neutron scattering on ThO_2 and UO_2, 18:2160 (R;SU;In Russian)

URANYL NITRATES
Role of ion transfer membrane in the production of uranous nitrate, 18:186 (R;IN)

URBAN AREAS
Urban environment and transport must always go hand-in-hand (Transport management), 18:874 (IA;DK;In Danish)

URINALYSIS

LOVIISA-2 REACTOR
A strategy for hydrogen risks in WWER nuclear power plants, 18:479 (RA;FR)
Catalytic recombination systems for severe accidents and noised-induced ignition to detonation transition effect, 18:476 (RA;FR)
Hydrogen behaviour in VVER - 440 nuclear power plants in case of severe accidents, 18:478 (RA;FR)
Hydrogen mitigation technical means of nuclear power plants, 18:473 (RA;FR)
Some aspects of hydrogen catalytic recombiner operation under severe accident conditions, 18:477 (RA;FR)

X

X RADIATION
Experimental measurements of total attenuation cross section and photoelectric cross section for Fe, Cu, Sn, Y, SiH_4 and Si in the X-ray energy range of 1,4 KeV - 29 KeV: Final report for the period 15 December 1988 - 14 May 1992, 18:2058 (R;XA)
X-2830 RESONANCES
See MESONS
X-RAY DIFFRACTION
Combined small-angle neutron and x-ray scattering studies of polymers, 18:1085 (R;US)
FEFF 5.03: Ab initio X-ray Absorption Fine Structure Code, 18:2422 (CM;US)
FEFF 5.03: Ab initio X-ray Absorption Fine Structure Code, 18:2424 (CM;US)
FEFF 5.03: Ab initio X-ray Absorption Fine Structure Code, 18:2423 (CM;US)
X-RAY RADIOGRAPHY
Ultra-fast secondary emission X-ray imaging detectors, 18:1414 (IA;IL)
Use of x-ray and fluoroscopy assays in the industry of armament and ammunition, 18:316 (I;BR;In Portuguese)
X-RAY SPECTROSCOPY
M-shell ionization probabilities in central collisions with energetic α projectiles, 18:2079 (RA;PL)
XENON
Analysis of forward and inverse problems in chemical dynamics and spectroscopy, 18:1172 (RA;US)
Study on diffusion of Xe implanted in polymer film at low temperature, 18:2172 (IA;BR;In Portuguese)

XENON 129
Charge exchange of very heavy ions in carbon foils and in the residual gas of the Ganil cyclotrons, 18:2032 (R;FR)

Y

Y*RESONANCES
See BARYONS
Y-12 PLANT
Phase 2 Sampling Plan for Chestnut Ridge Operable Unit 2 (Filled Coal Ash Pond/Upper McCoy Branch) at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee: Environmental Restoration Program, 18:228 (R;US)
Procedure and analysis reports in support of the hollow clay tile wall testing program: Revision 1, 18:1124 (R;US)
Remedial Investigation work plan for Bear Creek Valley Operable Unit 2 (Rust Spoil Area, SY-200 Yard, Spoil Area 1) at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee, 18:296 (R;US)
YAMAGUCHI NONLOCAL POTENTIAL
See YAMAGUCHI POTENTIAL
YAMAGUCHI POTENTIAL
Separable potentials and the delta-nucleon interaction, 18:1998 (IA;BR)
YTTERBIUM
States of Yb impurities in semiconducting III-V crystals, 18:2257 (IA;BR;In Portuguese)
YTTERBIUM ALLOYS
Physics of YbBiPt, 18:1011 (R;US)
YTTRIUM
Experimental measurements of total attenuation cross section and photoelectric cross section for Fe, Cu, Sn, Y, SiH_4 and Si in the X-ray energy range of 1,4 KeV - 29 KeV: Final report for the period 15 December 1988 - 14 May 1992, 18:2058 (R;XA)
YTTRIUM 87
Applicability of cascade-evaporation model to the calculation of radiation damages due to ions with energies T>1 GeV, 18:1006 (R;SU)
YTTRIUM ALLOYS
Electric quadrupole oscillation spectrum of ^{59}Co in YCo_3, 18:999 (IA;BR;In Portuguese)
Low-temperature specific heat of YMn_2 in the paramagnetic and antiferromagnetic phases, 18:1018 (R;US)
YTTRIUM ALUMINIUM GARNETS
See ALUMINIUM OXIDES
YTTRIUM COMPOUNDS
YTTRIUM COMPOUNDS
See also YTTRIUM HYDRIDES
YTTRIUM OXIDES
Energy spectra and photoelectron work function from $YBa_2Cu_3O_7$ high-T_c superconductor, 18:2187 (R;SU;In Russian)
Investigation of Y-Ba-Cu-O films using backscattering of $^4He^+$ ions, 18:2161 (R;SU;In Russian)
Study on phase diagram of $YO_{1,5}$-CuO_x binary, 18:987 (IA;BR;In Portuguese)
YTTRIUM HYDRIDES
First-principles studies of phase stability and the structural and dynamical properties of metal hydrides: Progress report, September 15, 1991–September 14, 1992, 18:2090 (R;US)
YTTRIUM OXIDES
A study on the development of high Tc superconducting materials, 18:2227 (R;KR;In Korean)
Current transport across grain boundaries in $TlBa_2Ca_2Cu_3O_x$ thick polycrystalline films and $YBa_2Cu_3O_7$ step edges, 18:1031 (R;US)
Magnetic hysteresis and flux creep of $YBa_2Cu_3O_x$ grown by the melt-powder-melt-growth (MPMG) process, 18:1073 (R;US)
Modifications study of the electronic structure of silicon oxides (α-SiO_2), aluminium oxides (α-Al_2O_3) and yttrium oxides (Y_2O_3), induced by structural defects (non-stoichiometry, mechanical strains, high energy ions irradiation), 18:1042 (R;FR;In French)
Potentiometric analysis for determining copper charge and oxygen content in Cu base oxides, 18:1050 (IA;BR;In Portuguese)

Z

Z NEUTRAL BOSONS
Study of D^* charmed meson production in Z^0 boson decays observed by the DELPHI experiment at LEP, 18:1926 (R;FR;In French)
ZEA MAYS
See MAIZE
ZERO POWER REACTORS
See also IFR REACTOR
Analysis of selected fast critical assemblies using JENDL-2 based unadjusted multigroup data, 18:674 (R;IN)
ZINC
Zinc doping effect on YBaCuO, 18:2177 (IA;BR)
ZINC ALLOYS
A first-principles study of short range order in Cu-Zn, 18:966 (R;US)
ZINC COMPOUNDS
Desulfurization of hot fuel gas produced from high-chlorine Illinois coals: Technical report, March 1, 1992–May 31, 1992, 18:49 (R;US)
ZINC SULFIDE SOLAR CELLS
Polycrystalline thin film materials and devices: Annual subcontract report, 16 January 1991–15 January 1992, 18:372 (R;US)
ZIRCONIUM
Hydrogen absorption-desorption at metal surfaces, 18:985 (R;CA)
Ion exchange coupling - activity experiments, 18:1133 (R;US)
Mechano-chemical model of breakaway zirconium oxidation, 18:453 (RA;FR)
Near-field solubility studies, 18:248 (R;GB)
Progress report - chemistry and materials division 1985 July 01 - December 31, 18:2400 (R;CA)
Self-consistent calculation in direct space of charge transfer distribution in a-Zr, 18:2064 (IA;BR;In Portuguese)
ZIRCONIUM 89
Applicability of cascade-evaporation model to the calculation of radiation damages due to ions with energies T>1 GeV, 18:1006 (R;SU)
ZIRCONIUM ALLOYS
See also ZIRCONIUM BASE ALLOYS
A study on the proton beam irradiation effect in zircaloy using cyclotron, 18:1287 (R;KR;In Korean)
Anelastic relaxations in polycrystals and monocrystals of Nb-Zr alloys, 18:995 (IA;BR;In Portuguese)
Mu SR study of magnetic properties in hydrided $ZrMn_2$, 18:958 (R;FR)
New fuel element development report of meeting, June 16, 1952, 18:169 (R;US)
Study on the improvement of the properties of Zr alloys, 18:1009 (R;KR;In Korean)
ZIRCONIUM BASE ALLOYS
Trip report: Argonne National Laboratory, April 10, 1952, 18:978 (R;US)
ZIRCONIUM CARBIDES
Protection for crucibles of evaporation by electron gun, 18:1046 (IA;BR;In Portuguese)
ZIRCONIUM FLUORIDES
Methods for the preparation of ultra-pure anhydrous zirconium tetrafluoride from zirconium tetraborohydride, researches in connection with halide glasses, 18:1097 (R;FR;In French)
ZIRCONIUM HYDRIDES
Study of deuterium diffusion in amorphous $Zr_3RhD_{4.3}$ by ^{181}Ta spin relaxation, 18:2098 (R;FR)

Contract Number Index

Numbers assigned to DOE contracts announced in documents in this publication are listed. Contract numbers are sorted alphanumerically and list the primary corporate author of the document cited, the citation number, and the report number or other document identification.

Contract No.	Abstract No.	Report No.

Report Number Index

The report number index consists of the alphanumeric identifiers assigned to report literature as well as patent and conference literature cited in this publication. Entries provide the abstract number; the source(s) of availability of the document; the GPO file prefix for GPO depository library documents; the order number for OSTI and NTIS report ordering purposes; and, if the document was distributed under the DOE distribution program, the category number is shown for paper copy (PC), microfiche (MF), or no distribution (ND). These categories are included to assist DOE librarians in responding to requests for reports in their collections. The index also lists secondary numbers, with the corresponding abstract numbers and cross-references to other identifying numbers.

Codes Used on Index Lines

Following the citation numbers in the Corporate Author, Personal Author, and Subject Indexes, codes are used to designate the type of document, country of publication, and language of the document, e.g., (R;SU;In Russian). The language designator does not appear if the document is published in English.

ORDER FORM

DOE and DOE Contractors: Fill in Parts I, II, and IV. **Others:** Fill in Parts I, III, and IV. Mark appropriate blanks in Part IV to indicate quantity and form (microfiche or paper copy).

I. SHIPPING AND PAYMENT INFORMATION

Ordering Address

Name _____ Telephone _____

Address _____

City _____ State _____ Zip _____

Shipping Address (if different from above)

Name _____

Address _____

City _____ State _____ Zip _____

_____

SIGNATURE (Required to validate ALL orders)

II. OSTI ORDERS (DOE and DOE contractors can order from OSTI.)

☐ Charge OSTI deposit account no. _____

Mail orders to: U.S. Department of Energy
Office of Scientific and Technical Information
P.O. Box 62
Oak Ridge, TN 37831

III. NTIS ORDERS

☐ Charge NTIS deposit account no.

☐ Check/Money Order enclosed for $

☐ Charge to my ☐ American Express ☐ VISA ☐ Mastercard

_____ _____
Account Number **Card expiration date**

☐ Ship and Bill (see below for restrictions)

Employer identification number (9 digits) _ _–_ _ _ _ _ _ _

Purchase Order number _____

Phone number of billing office _____
(Required for Ship & Bill orders)

Ship & Bill service is restricted to North American business locations for an extra $7.50 per order (or per Custom Search). The business' employer identification number plus the phone number of the office paying the bill are required to process these requests. A late payment charge will be applied to billings more than 30 days overdue. Prepaying, using an NTIS Deposit Account or a charge account, speeds order processing. Be sure payment and order are sent together. Checks, payable to NTIS, must be in U.S. dollars.

Mail orders to: U.S. Department of Commerce
National Technical Information Service
5285 Port Royal Road
Springfield, VA 22161

IF NO METHOD OF PAYMENT IS INDICATED, YOUR ORDER WILL BE RETURNED TO YOU AS A PRICE QUOTE UNPROCESSED.

IV. SELECTIONS

Order number _____ Report number _____

Federal Depository Library Program

As a result of an agreement between the U.S. Government Printing Office (GPO) and the Department of Energy, beginning in 1984 DOE reports with unlimited distribution are now included in the Federal Depository Library Program. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and interlibrary loans; however, they are not sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself. Do not send checks or orders to these libraries.
